

# Software Requirements

## Specification

### for Queue.Me

The screenshot shows the Queue.Me mobile application's landing page. At the top, there is a navigation bar with links for "Home", "Our Doctors", "Appointments", "Sign in", "SIGN UP", and a language selector "EN". Below the navigation, a large promotional message reads: "Skip long waits at the clinic. Book an appointment and walk in right before your turn." It includes a subtext: "Book appointments with the right healthcare professional based on your needs, schedule, and location. Simplify your healthcare journey and focus on getting better. Your well-being is just a click away!" A prominent green button labeled "Get started now" is located below this text. To the right of the text, there is a graphic illustration of a hand holding a smartphone displaying a calendar-like interface, connected by dashed lines to circular icons representing doctors and medical data. Below this section, there is a teal-colored footer bar. On the left side of the footer, it says "More than 1 million 5 star reviews" and has links for "Get the app now" with "Download on the App Store" and "GET IT ON Google Play" buttons. On the right side of the footer, there are three customer review snippets, each with a 5-star rating icon. The first review says: "This app has been lifesaver! I could easily find a doctor nearby who fit my schedule, and the booking process was seamless. The reminders were super helpful, and I loved how I could see reviews for the doctors before booking. Highly recommend it!" The second review says: "I used to struggle with finding the right specialist, but this platform made it so easy. I found an amazing doctor who really understood my needs, and the virtual consultation option saved me a lot of time. Such a convenient service!" The third review says: "The app works really well, and I love how it shows availability in real-time. The only reason I'm giving 4 stars instead of 5 is that I wish they had more specialists in my area. Otherwise, it's an excellent service!"

## Revision History

Name	Date	Reason For Changes	Author	Version
Part A	09/05/24	First version's SRS Part A is defined	BS	v1.0
Part A	09/12/24	SRS template is updated, System Context Diagram is updated, and SRS Part A is revised	AT, BS	v1.1
Part A	09/19/24	SRS Part A is revised, and added use cases	LM, AT, JJ, MQ, BS	v1.2
Part A	09/24/24	Updated SRS Part A and use cases as per current requirements, added ERD, user stories, and acceptance criteria. Also, removed sections from previous semester	AT, JJ, MQ, BS,	v1.3
Part A	09/30/24	Added Sequence and State Diagrams	JJ, MQ	v1.4
Part A	10/17/24	Update on SRS Part A Overall Feedback	AT, JJ, BS, MQ	v1.5
Part B	10/28/24	SRS Part B is defined	BS	v2.0
Part B	11/04/24	Update on SRS Part A additional Feedback	AT, JJ	v2.1
Part C	11/09/24	SRS Part C is defined	BS	v3.0
Part B	11/15/24	Update on SRS Part B Overall Feedback	AT, JJ, BS, MQ	v3.1
Part C	11/13/24	Added Section 1 and 2 Software Design Patterns	AT, BS, LM	v3.1
Part C	11/18/24	Added Section 3 UI/UX Design (mobile/web) and section 5 Gantt Chart	JJ, MQ, BS	v3.1
Part C	11/23/24	Added and revised Section 4 High-Level Component/Deployment Diagram	JL, BS	v3.2
Part C	12/02/24	Added navigation pages for Section 3 UI/UX Design in web	MQ	v3.2
Part C	12/04/24	Updated Section 4 High-Level Component/Deployment Diagram based on feedback	BS	v3.3

# Part A: Project Scope and Requirements

## Section 1: Problem Statement

### 1.1.a Problem Domain and Need

The healthcare landscape is brimming with appointment booking solutions. While existing products and applications offer basic functionalities, Queue.Me takes a revolutionary leap forward by delivering a more comprehensive and patient-centric platform that simplifies appointment booking and enhances communication between patients and healthcare providers.

With AI-driven scheduling, centralized medical records, and virtual consultation capabilities, Queue.Me empowers patients to manage their care while streamlining administrative tasks for healthcare professionals. This comprehensive solution improves access to healthcare, reduces wait times, and optimizes resource management, ultimately contributing to better patient outcomes and satisfaction.

### 1.1.b List of Capabilities and Benefits

To improve the experiences of patients and providers in the healthcare system, Queue.Me provides a unique combination of cutting-edge features and useful advantages. The list of essential capabilities and benefits that go along with them is as follows:

#### Capabilities:

1. User and Account Management - For both patients and physicians, secure account creation, login, profile maintenance, and password recovery are essential.
2. AI-Powered Appointment and Queue Management - To cut down on wait times and boost productivity, intelligent scheduling and rescheduling via chatbots with automatic reminders and real-time updates is implemented.

3. Virtual Consultation and Medical Records Access - Patients can safely access or share their medical records with their doctors and consult them from a distance to improve care coordination.
4. Integrated Payment and Feedback System - Patients can evaluate and review doctors after appointments, and payments are processed securely with payment history accessible.

**Benefits:**

1. Improved User Experience - A patient-friendly interface and easy user account management make it easier for patients and providers to communicate.
2. Enhanced Access to Healthcare - A wider range of people may now access healthcare more easily thanks to AI-driven appointment scheduling, online consultations, and current medical information.
3. Efficient Care and Resource Management - Wait times are decreased and healthcare operations are improved through AI-powered queue management, real-time notifications, and resource allocation optimization.
4. Seamless Medical Record Access - During consultations, informed, consistent care is guaranteed by secure sharing and access to medical history.
5. Streamlined Payments and Patient Satisfaction - Increased patient satisfaction and service trust are the results of transparent payment processing and the option to rate and review physicians.

**1.2. Identify the Stakeholders & their Roles**

There are various types of users that will interact with Queue.Me.

- Patients - will use the platform to book appointments, access medical reports & prescriptions, and review doctors.
- Doctors - will use software to manage their schedules, view appointments, access medical records, communicate with patients, provide prescriptions digitally and consult with patients virtually.

- Medical receptionist / clinical staff - will use software to manage appointments, handle inquiries & process payments. They have limited access to doctor's account.
- Hospital and Clinics – organizations where doctors and medical staff work. They benefit from streamlined appointment scheduling and patient management.
- Pharmacy Services – Providers who will fill prescriptions generated by doctors within the system.
- System Administrator – The System Administrator's job is to ensure the software runs smoothly and troubleshoots any problems.
- Investors – The investors will fund the development and expansion of the system.
- IT and Development Team – These people are responsible for building, maintaining, and upgrading of the system.

### **1.3. Identify the Sub-systems of your Application**

There are various sub-systems for the Queue.Me application.

- User Management Subsystem
- Appointment Management Subsystem
- Medical Records Management Subsystem
- Rating and Review Subsystem
- AI Integration Subsystem
- Administrative Subsystem
- Payment Management Subsystem

### **1.4. Intended Users or Audience and Reading Suggestions**

This document for the Queue.Me system is intended for a variety of stakeholders involved in the project.

- Software Developers (Devs) - Devs should focus on the functional and non-functional requirements section, and other technical details included in this document.

- Project Managers (PM) - PMs should review sections 1 (Introduction), 2 (Overall Description), and skim sections 3 (Requirements) and 4 (System Features) for a high-level understanding.
- Business Analysts/Product Owners (BA/PO) - BAs and POs should focus on Sections 1 (Introduction), 2 (Overall Description), and 3 (Requirements).
- Software Quality Assurance (QA) Engineers - QAs should focus on Section 3 (Requirements) and 4 (System Features) to understand expected system behavior and functionalities to be included during testing.
- Technical Writers (Optional) - Technical writers should review Section 1 (Introduction), 2 (Overall Description), and 3 (Requirements) to understand user interactions and system functionalities.
- End Users - End Users such as doctors and patients can refer to section 3 (Requirements) and 4 (System Features) for the list of requirements. Additionally, they should focus on section 1 (Introduction) and 2 (Overall Description) and refer to section 2.6 (User Documentation) for tutorials and support information of the system.

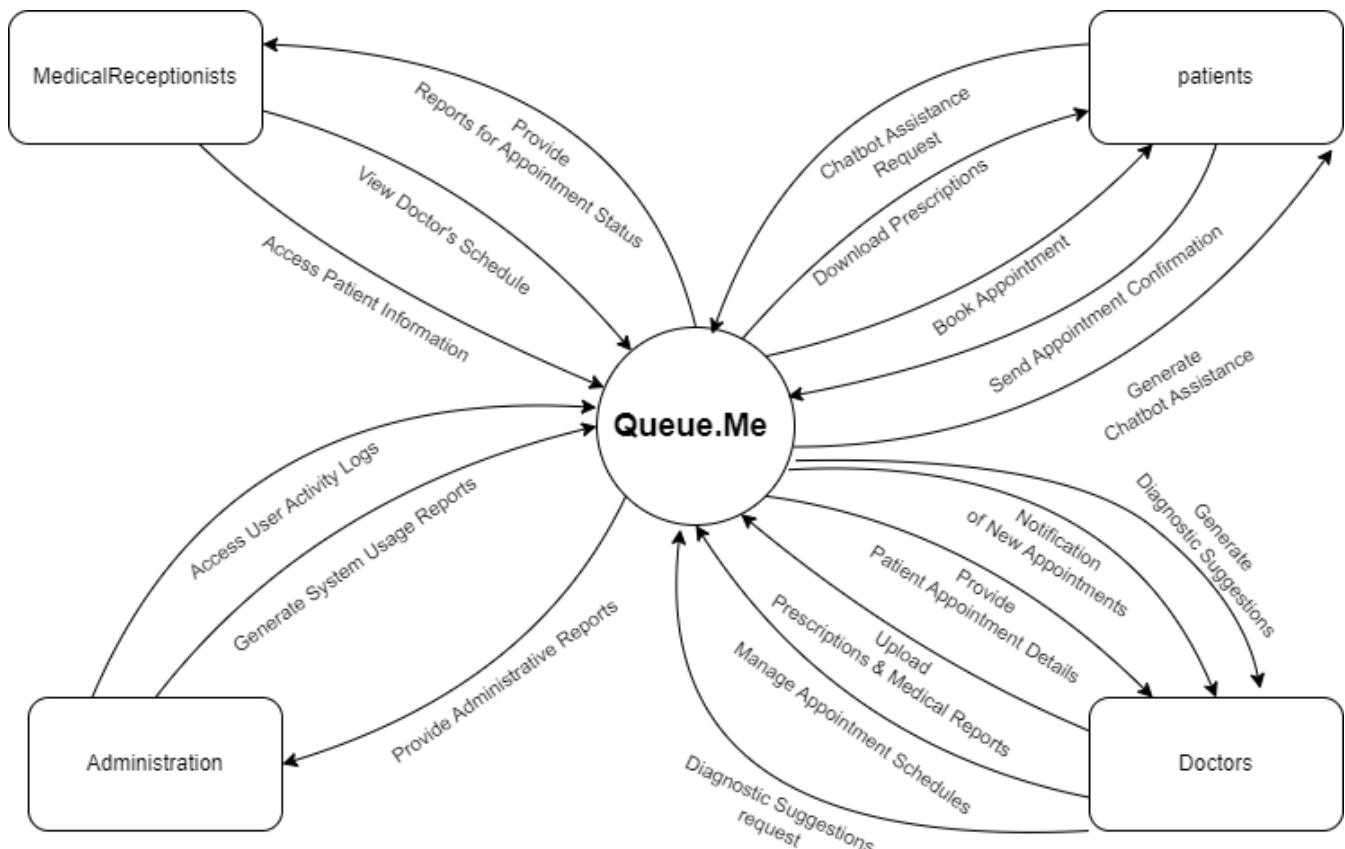

It is recommended to read this document sequentially. Readers with a strong technical background can skim Introduction and Overall Description and delve deeper into technical details in Requirements, System Features, Functional and Non-Functional Requirements. While non-technical individuals can focus on Introduction, Overall Description and Requirements for a general understanding of the system's purpose and functionalities.

## Section 2: Context Flow Diagram Structured Overview

### 2.1. Context Flow Diagram (CFD)

This section of the SRS outlines the context flow diagram of Queue.Me. These interfaces define how the system interacts with the users.

The users will access the software using a mobile app will support both iOS and Android platforms, while the web interface will support modern web browsers such as Google Chrome, Mozilla Firefox, Safari, and Microsoft Edge. The backend will utilize a JSON Node.js server for efficient and secure data management.

System Context Diagram

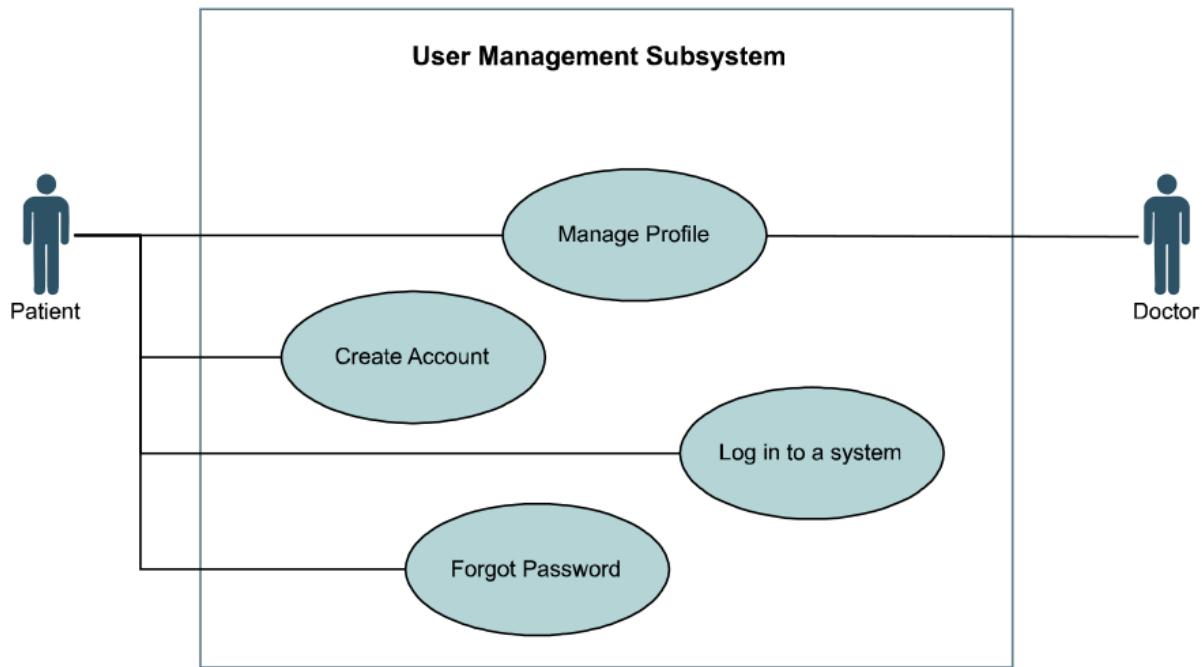

## Section 3: Functional Requirements

### 3.1. Goal Use Cases List, Use Case Diagrams (3.2) and User Stories (3.3) for each Sub-systems

This document details the **goal use cases list (3.1)**, **use case diagrams (3.2)** and **user stories (3.3)** for each sub-systems for the Queue.Me application with their role players and descriptions.

#### 3.1.1. User Management Subsystem

FR #	Goal Use Case	Role Player	Description
FR01	Create Account	Patient, Doctor	Patients and doctors click the sign-up button, fill out a registration form, and create an account in the system.
FR02	Edit Profile	Doctor	Doctor edits their profile to add or update personal information.
FR03	Login User	Patient, Doctor	Patients and doctors enter their credentials (username and password) to access their accounts in the system.
FR04	Request Password Reset	Patient, Doctor	Patients and doctors who forget their passwords can request a password reset. They will receive instructions via email to reset their password securely.
FR05	Authenticate User	Patient, Doctor	Patients and doctors authenticate their identity through various methods (login, password recovery) to ensure secure access to the system.

**Use case Diagram:****User Story:****1. Create Account**

**As a Doctor/Patient,**  
**I want to** create an account  
**so that** I can access the system to manage appointments and my medical profile.

**Acceptance Criteria:**

- The user can click the sign-up button.
- The registration form must include fields for necessary information.
- Upon submission, the account is created successfully.

**2. Edit Profile**

**As a Patient/Doctor,**  
**I want to** edit my profile  
**so that** I can update my professional information.

**Acceptance Criteria:**

- The patient/doctor can access and edit the profile page.
- Changes are saved and reflected in the profile right away.

**3. Login User**

**As a Patient/Doctor,**

**I want to** login into my account

**so that** I can access my personal information and manage my medical appointments.

**Acceptance Criteria:**

- The patient/doctor can navigate to the login page from the main application interface.
- The login page must include fields for entering a username and password, along with a “Login” button.
- Passwords are encrypted during input and not displayed in plain text.
- Upon entering valid credentials, the user is navigated to their dashboard.
- If invalid credentials are entered, an error message is displayed indicating that the username or password is incorrect.
- A “Forgot Password” link is available on the login page, redirecting the user to a password recovery page.
- A logout button is accessible in the user interface once logged in.

**4. Request Password Reset**

**As a Patient/Doctor,**

**I want to** reset my password if I forgot it

**so that** I can regain access to my account securely.

**Acceptance Criteria:**

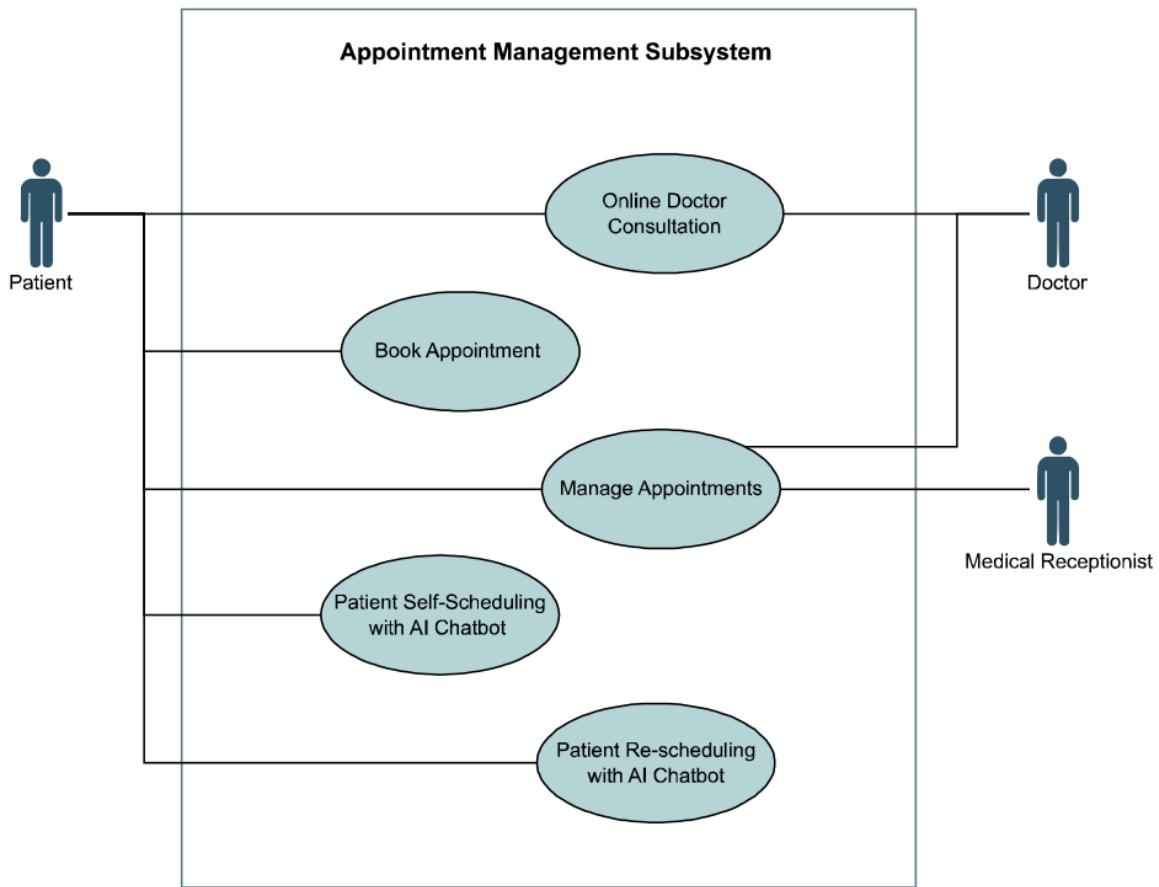

- Clicking the “Forgot Password” link from the login page redirects the user to a password recovery page.
- The password recovery page must include a field for entering the registered email address.

- Upon submission of the email address, the system sends a password reset link to the user's registered email.
- The user can set a new password using the link provided in the email.

### 3.1.2. Appointment Management Subsystem

FR #	Goal Use Case	Role Player	Description
FR01	Book Appointment	Patient, Medical Receptionist	Patient searches for doctors by name, specialty or location, views profiles, and selects available time slots. The system ensures real-time availability by cross-referencing the doctor's schedule, which is managed and updated by the medical receptionist to avoid conflicts.
FR02	Conduct Online Consultation	Patient, Doctor	Patients can opt for online consultations, facilitating remote medical advice and reducing the need for physical visits.
FR03	Manage Appointments	Doctor, Patient, Medical Receptionist	Doctor, patient, and medical receptionist view, cancel, or reschedule appointments, receiving notifications for any changes made.
FR04	Schedule with AI	Patient, AI	Patients interact with an AI chatbot to schedule a medical appointment based on preferences and availability.
FR05	Re-Schedule with AI	Patient, AI	Patient uses the AI chatbot to reschedule an existing appointment, receiving updated notifications.

### Use case Diagram:

### User Story:

#### 1. Book Appointment

**As a Patient,**

**I want to book an appointment with a doctor**

**so that I can receive the medical attention I need at a convenient time.**

### Acceptance Criteria:

- The patient can search for doctors by name, specialty, or location.
- The system displays available time slots based on the doctor's schedule, which is managed and updated by the medical receptionist thru the system.
- The patient can select an available time slot that is verified to be available, accounting for cancellations or rescheduling managed by the medical receptionist.

- The system prevents double-booking by cross-referencing the doctor's real-time appointment data.
- Upon booking, the appointment is confirmed and added to both the patient's and doctor's calendars.

## 2. Conduct Online Consultation

**As a Patient,**

**I want** to receive consultations online

**so that** I can get advice without needing to visit the clinic in person.

### Acceptance Criteria:

- The patient can choose to have an online consultation when booking an appointment.
- The system provides a secure video or chat interface for the consultation.
- The patient receives confirmation of the online consultation with all necessary details (date, time, access link).
- Any prescribed medication is noted and prepared for pickup or delivery.

## 3. Manage Appointments

**As a Doctor/Patient/Medical Receptionist,**

**I want** to manage my appointments

**so that** I can keep track of my schedule and make necessary changes if needed.

### Acceptance Criteria:

- Users can view all appointments in a list.
- Users can cancel or reschedule appointments easily.
- Notifications are sent for any changes made to appointments.

## 4. Schedule with AI

**As a Patient,**

**I want to** schedule an appointment using an AI chatbot

**so that** I can quickly find and book a suitable time without hassle.

**Acceptance Criteria:**

- The chatbot asks for the patient's preferences.
- The chatbot displays available slots and books the appointment.
- The patient receives a confirmation message.

**5. Reschedule with AI**

**As a Patient,**

**I want to** reschedule my appointment using the AI chatbot

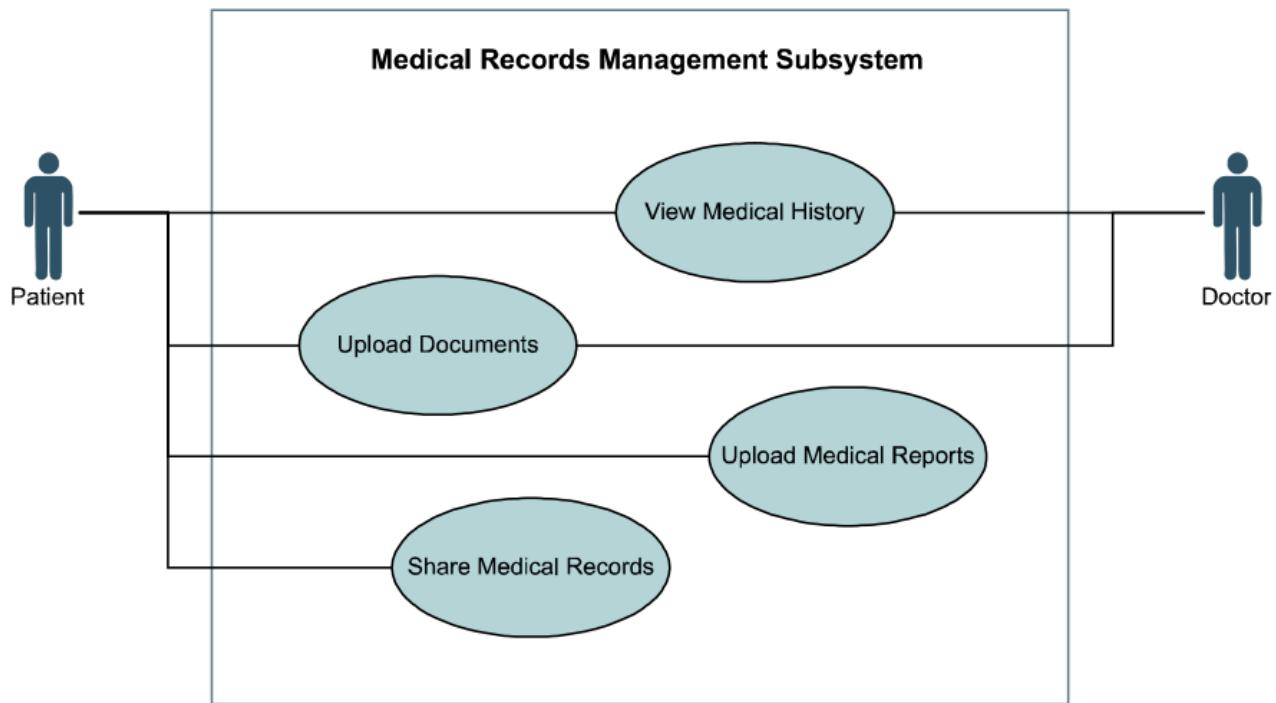

**so that** I can easily find a new time that works for me without hassle.

**Acceptance Criteria:**

- The chatbot retrieves the patient's current appointment.
- The chatbot suggests alternative time slots.
- The rescheduled appointment is confirmed and updated in the system.

**3.1.3. Medical Records Management Subsystem**

FR #	Goal Use Case	Role Player	Description
FR01	Upload Documents	Patient, Doctor, Medical Staff	Doctors and Medical staff can upload prescriptions and reports; patients can view them and receive copies thru email.
FR02	View Medical History	Patient, Doctor	Both patient and doctor can access the complete medical history, including previous visits and prescriptions.
FR03	Share Medical Records	Patient	Patients share their medical records with other healthcare providers thru various methods.
FR04	Upload Medical Records	Patient	Patients can upload medical reports for doctor review prior to their consultations.

**Use case Diagram:****User Story:****1. Upload Documents**

**As a Doctor/Medical Staff,**

**I want to** upload medical documents to the system

**so that** they can be easily accessed by the patient for future reference.

**Acceptance Criteria:**

- The doctor or medical staff can select and upload medical documents to the patient's record.
- The uploaded documents are securely stored in the patient's medical records and made available for the patient to access.
- The patient receives a confirmation email.

**2. View Medical History**

**As a Patient,**

**I want to** view my medical history

**so that** I can keep track of past visits and treatments.

**Acceptance Criteria:**

- The user can access a complete medical history page.
- The history includes previous visits, treatments, and prescriptions.
- The information is displayed in an easily accessible and readable format.

**3. Share Medical Records**

**As a Patient,**

**I want** the system to securely share my medical records via email

**so that** I can facilitate my care with other healthcare providers while ensuring privacy and security.

**Acceptance Criteria:**

- The system automatically sends the selected records via a secure, encrypted email.
- Recipients can access the shared records only through an encrypted link in the email, with proper authentication for security.
- Requires the recipient to authenticate their identity (e.g., using a multi-factor authentication process) and has a time-limited expiration to restrict access after a set period.

**4. Upload Medical Reports**

**As a Patient,**

**I want to** upload my medical reports

**so that** my doctor can review them before my consultation.

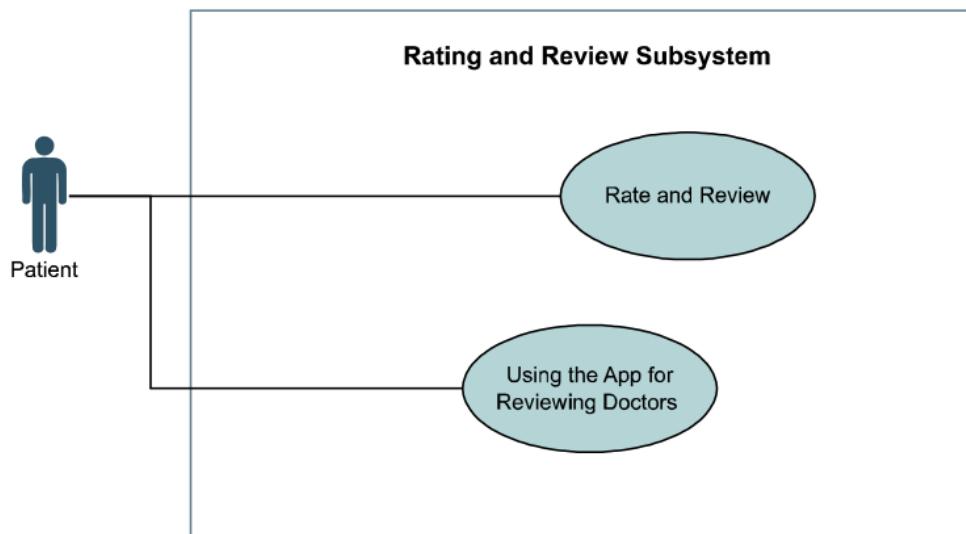

**Acceptance Criteria:**

- The patient can easily select and upload files.
- The doctor can access the uploaded reports in their system.
- The patient receives confirmation of the upload.

### 3.1.4. Rating and Review Subsystem

FR #	Goal Use Case	Role Player	Description
FR01	Rate and Review	Patient	After an appointment, patients can rate the service and leave reviews on the doctor's profile page.
FR02	Review Doctors	Patient	Patients can use the app to view doctor ratings and reviews before scheduling.

#### Use case Diagram:

#### User Story:

##### 1. Rate and Review

**As a Patient,**

**I want to** rate and review my doctor

**so that** I can share my experience and help others make informed decisions.

#### Acceptance Criteria:

- The patient can leave a rating and write a review after an appointment.
- The review is visible on the doctor's profile page.
- The patient receives confirmation that their review has been submitted.

## 2. Review Doctors

**As a Patient,**

**I want to** see ratings and reviews of doctors

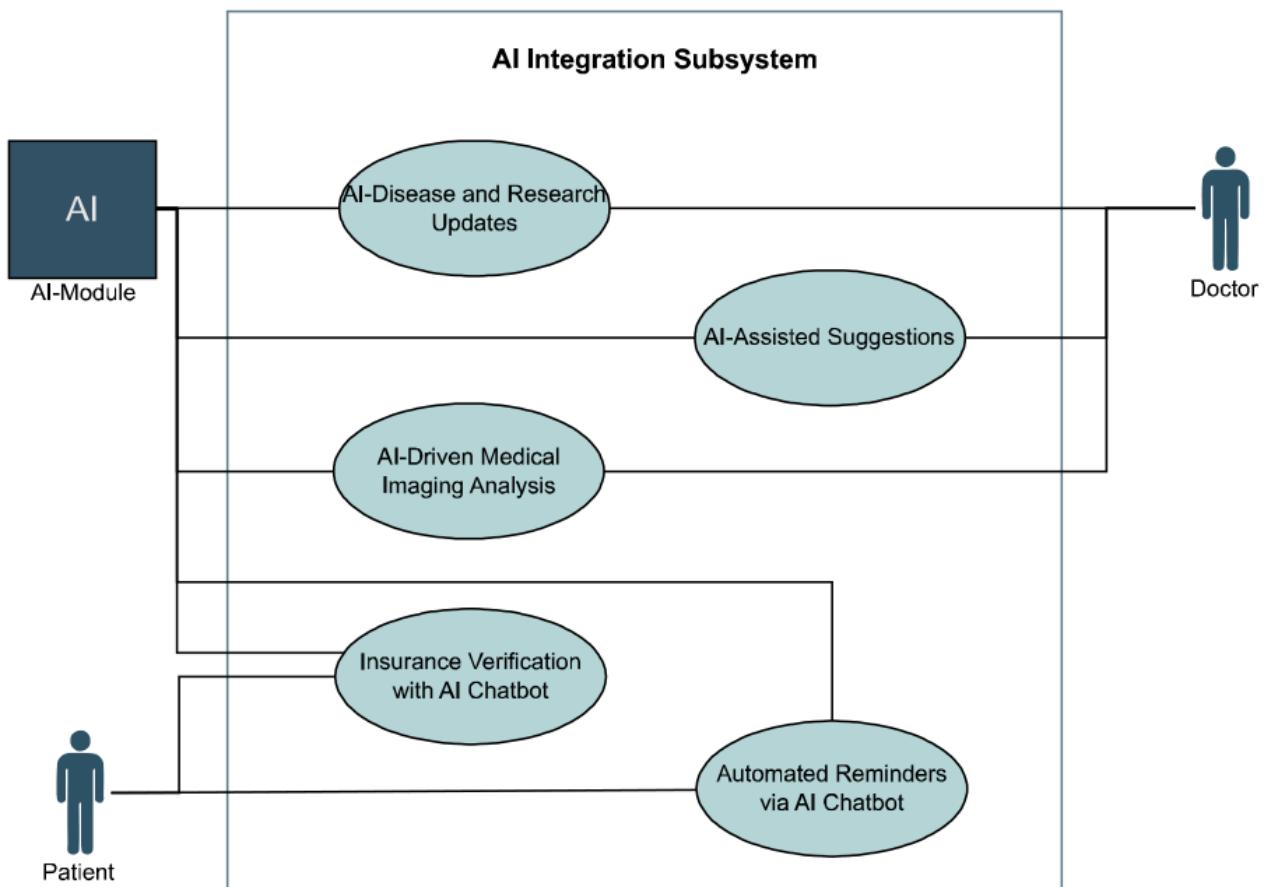

**so that** I can choose the best healthcare provider for my medical needs.

### Acceptance Criteria:

- The patient can access a list of doctors with their ratings and reviews.
- Reviews include details and feedback from other patients.
- The information is updated in real-time.

### 3.1.5. AI Integration Subsystem

FR #	Goal Use Case	Role Player	Description
FR01	Update Medical Information	Doctor, AI	The AI provides up-to-date information on diseases and research findings to support doctors.
FR02	Suggest Treatments	Doctor, AI	The AI suggests treatments based on patient data and current research trends.
FR03	Analyze Medical Imaging	Doctor, AI	The AI analyzes medical images (e.g., X-rays, MRIs) to provide diagnostic support to doctors.
FR04	Send Automated Reminders	Patient, AI	The AI chatbot sends automated appointment reminders to patients via their preferred communication channel.
FR05	Verify Insurance Coverage	Patient, AI	Patients use the AI chatbot to verify their insurance coverage and understand co-pays.

**Use case Diagram:****User Story:****1. Update Disease and Research Information**

As a Doctor,

I want to receive updates on diseases and research

so that I can stay informed and provide the best care.

**Acceptance Criteria:**

- The AI system delivers timely updates on relevant medical research.
- Doctors can access and review this information easily.
- Notifications are sent for significant updates.

## 2. Suggest Treatments

**As a Doctor,**

**I want to receive AI-assisted treatment suggestions  
so that I can make informed decisions based on the latest trends.**

### Acceptance Criteria:

- The AI provides suggestions based on the patient data.
- The doctor can review and accept or modify the suggestions.
- Suggestions are documented in the patient's record.

## 3. Analyze Medical Imaging

**As a Doctor,**

**I want to receive AI analysis of medical images  
so that I can improve diagnostic accuracy and speed.**

### Acceptance Criteria:

- The AI analyzes images and provides a report.
- The doctor can access the analysis alongside the images.
- Feedback on the analysis is available for the doctor.

## 4. Send Automated Reminders

**As a Patient,**

**I want to receive automated appointment reminders  
so that I don't forget my upcoming appointments.**

### Acceptance Criteria:

- The AI chatbot sends reminders via the patient's preferred communication method.
- Reminders include date, time, and location of the appointment.
- The patient can confirm or reschedule directly from the reminder.

## 5. Verify Insurance Coverage

**As a Patient,**

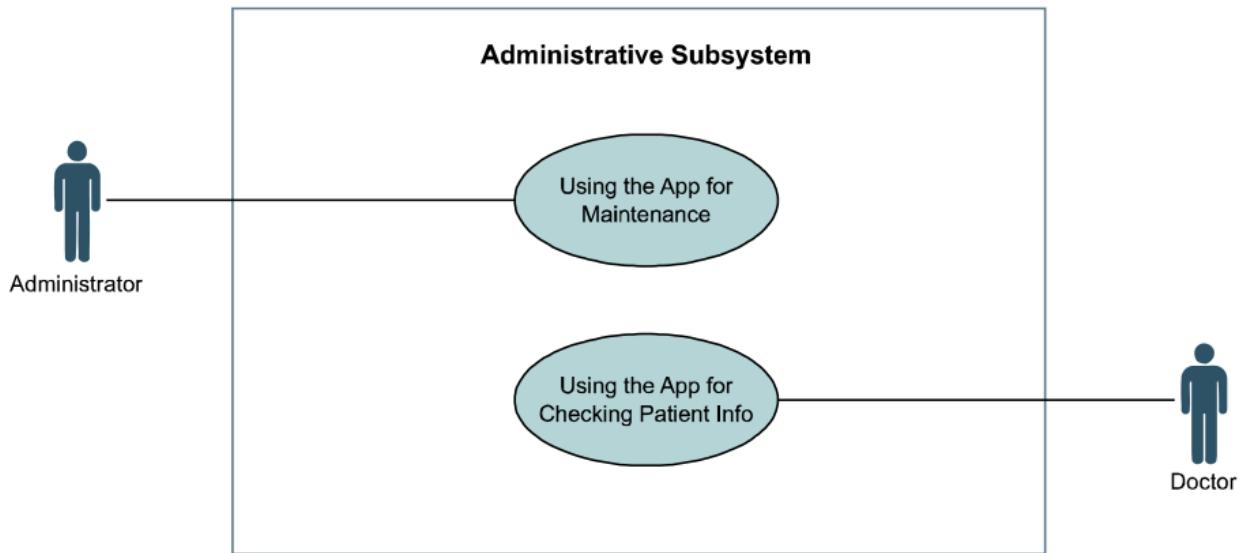

**I want to** verify my insurance coverage through the AI chatbot  
**so that** I can understand my costs before booking an appointment.

### Acceptance Criteria:

- The chatbot accesses the patient's insurance information.
- The patient receives a clear breakdown of coverage and costs.
- The information is provided in real-time.

### 3.1.6. Administrative Subsystem

FR #	Goal Use Case	Role Player	Description
FR01	Maintain System	Administrator	Administrators use the app to manage system maintenance and monitor performance.
FR02	Check Patient Information	Doctor	Doctors check patient information frequently to ensure accurate diagnoses and treatment plans.
FR03	Manage Notifications	Patient, Doctor, Medical Receptionist, Administrator	The system sends notifications to users regarding appointment confirmations, reminders, and important updates.

**Use case Diagram:****User Story:****1. Maintain System**

**As an Administrator,**

**I want to** manage the Queue.Me's maintenance

**so that** I can ensure smooth operation and address any issues.

**Acceptance Criteria:**

- The administrator can access maintenance tools.
- Reports on system performance are available.
- Notifications for issues are sent to the administrator.

**2. Check Patient Information**

**As a Doctor,**

**I want to** check patient information easily

**so that** I can provide timely and accurate care.

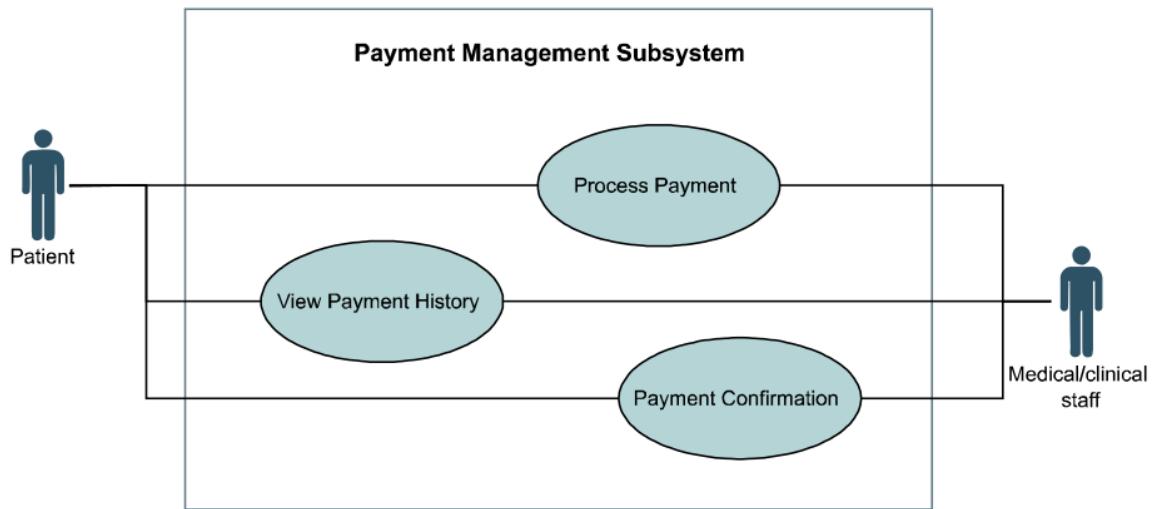

**Acceptance Criteria:**

- The doctor can access a patient's complete profile quickly.

- The information includes medical history, current treatments, and prescriptions.
- The system allows for easy navigation between different patient profiles.

### 3.1.7. Payment Management Subsystem

FR #	Goal Use Case	Role Player	Description
FR01	Process Payment	Patient, Medical/clinical Staff	Patients can enter payment information to complete the transaction for their appointments. While medical/clinical staff manage and verify the payment process.
FR02	View Payment History	Patient, Medical/clinical Staff	Patients and medical/clinical staff can view a history of past payments for services rendered.
FR03	Confirm Payment	Patient, Medical/clinical Staff	After a successful transaction, Queue.Me sends a confirmation message or email to the patient, and clinical staff monitor and confirm payment records.
FR04	Verify Payment	Patient	The system verifies the validity of the payment method (e.g., credit card) before processing the payment to reduce transaction errors.

**Use case Diagram:****User Story:****1. Process Payment**

**As a Patient,**

**I want to** securely process my payment for appointments  
**so that** I can confirm my booking.

**Acceptance Criteria:**

- The payment page must be accessible after booking an appointment.
- Users must be able to select a saved payment method or enter a new payment information.
- Upon submitting payment, the system securely processes the transaction and displays a confirmation message.
- Medical/clinical staff can access the details to verify and manage the transaction.
- Users receive an email receipt confirming the payment and appointment details.

**2. View Payment History**

**As a Patient,**

**I want to** view my payment history  
**so that** I can keep track of my expenses related to appointments.

**Acceptance Criteria:**

- The payment history page must be accessible from the user's profile.
- The page must display a list of past transactions, including date, amount, and appointment details.
- Medical/clinical staff can view patient payment history for record-keeping.
- Users must be able to filter the payment history by date range or appointment type.
- Users can click on a transaction to view detailed information.

**3. Confirm Payment**

**As a Patient,**

**I want to receive a confirmation of my payment**

**so that I can have a record of the transaction.**

**Acceptance Criteria:**

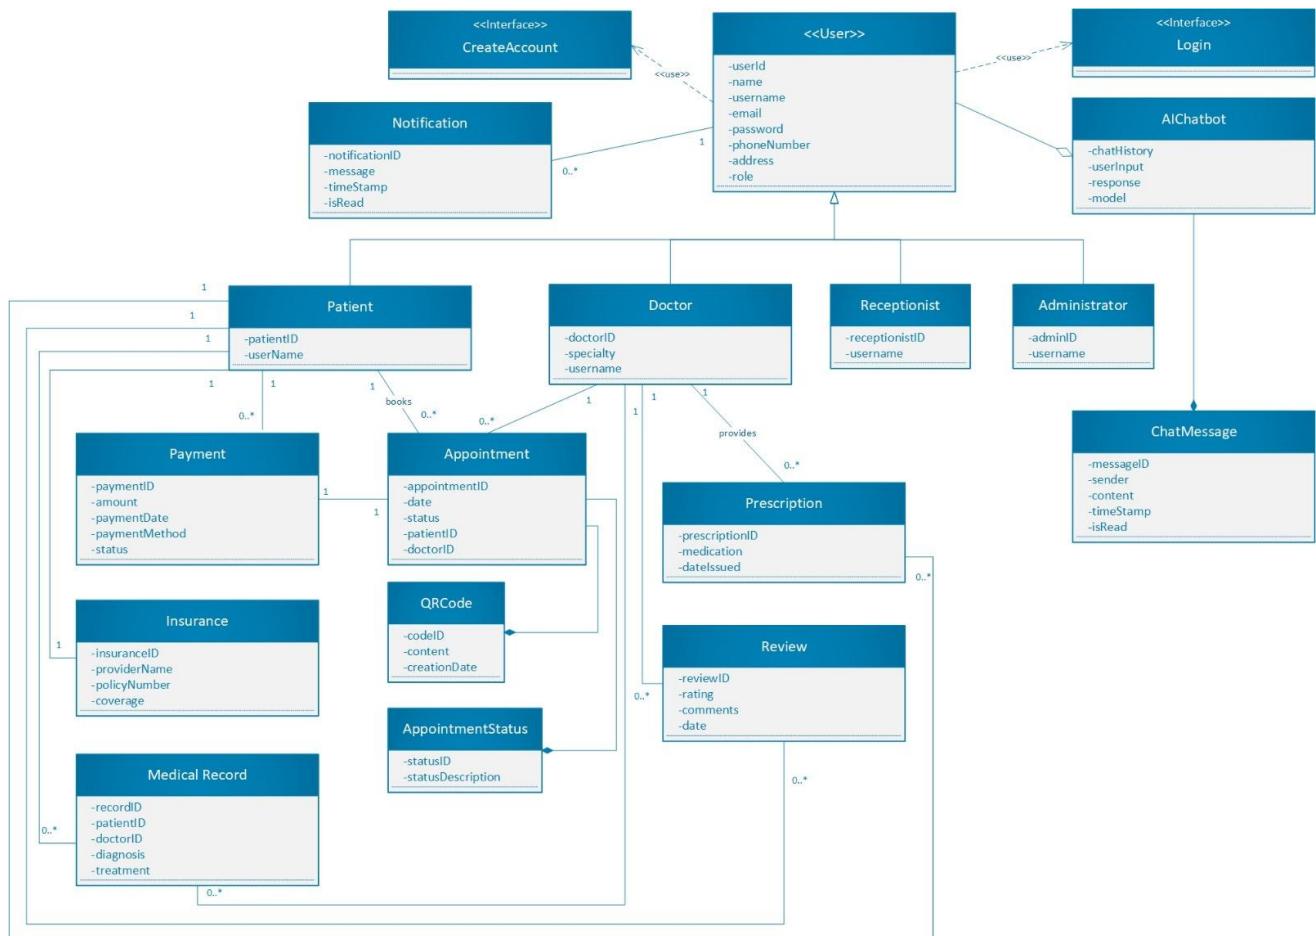

- Upon successful payment processing, Queue.Me displays a confirmation message on the screen indicating that the payment was successful.
- An email receipt must be sent to the patient's registered email address, detailing the payment amount, appointment date and time, and any other relevant information.
- Medical/clinical staff can confirm payment details.
- The payment confirmation details must be accessible in the patient's account under the payment history section.
- The confirmation message must be displayed immediately after payment processing, and the email should be sent within a few minutes.
- If there is an issue sending the email, the system should display a warning message and log the error for administrative review.

|---|--|

### 4.2. Domain Class Diagram

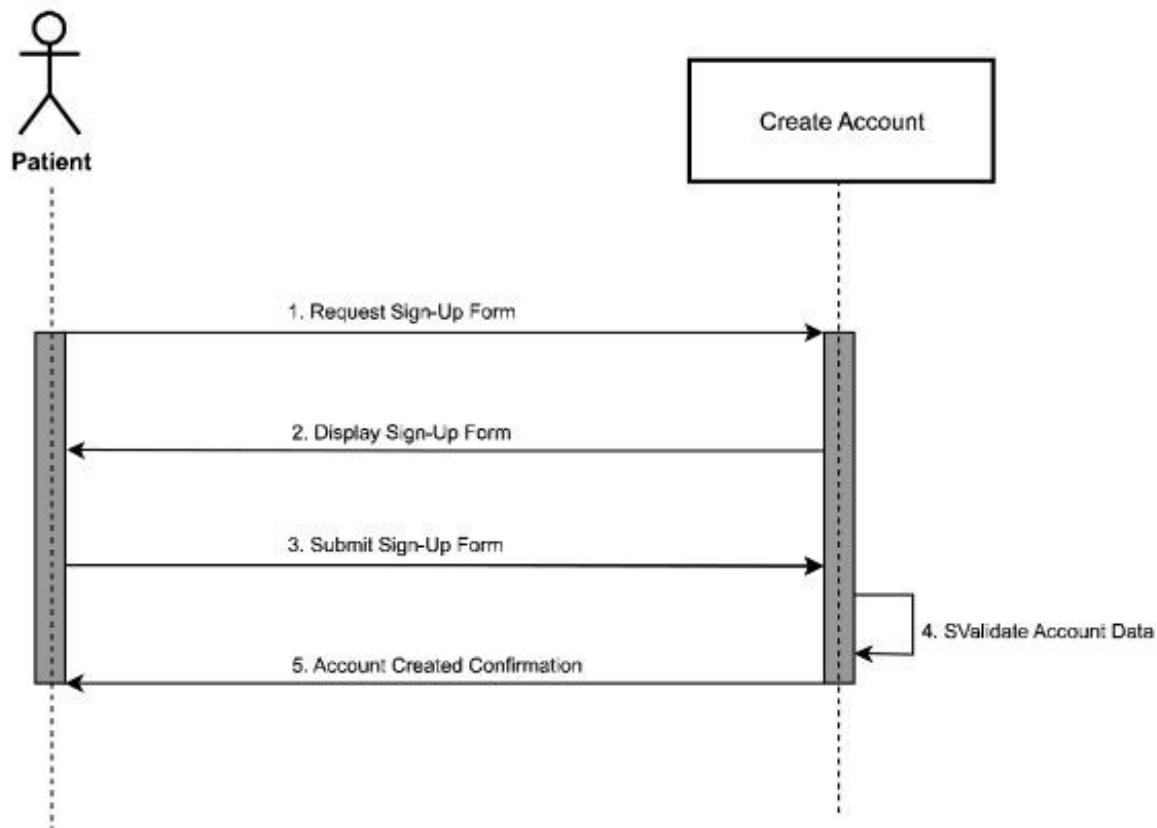

## Section 5: Entity Relationship Diagram (ERD)

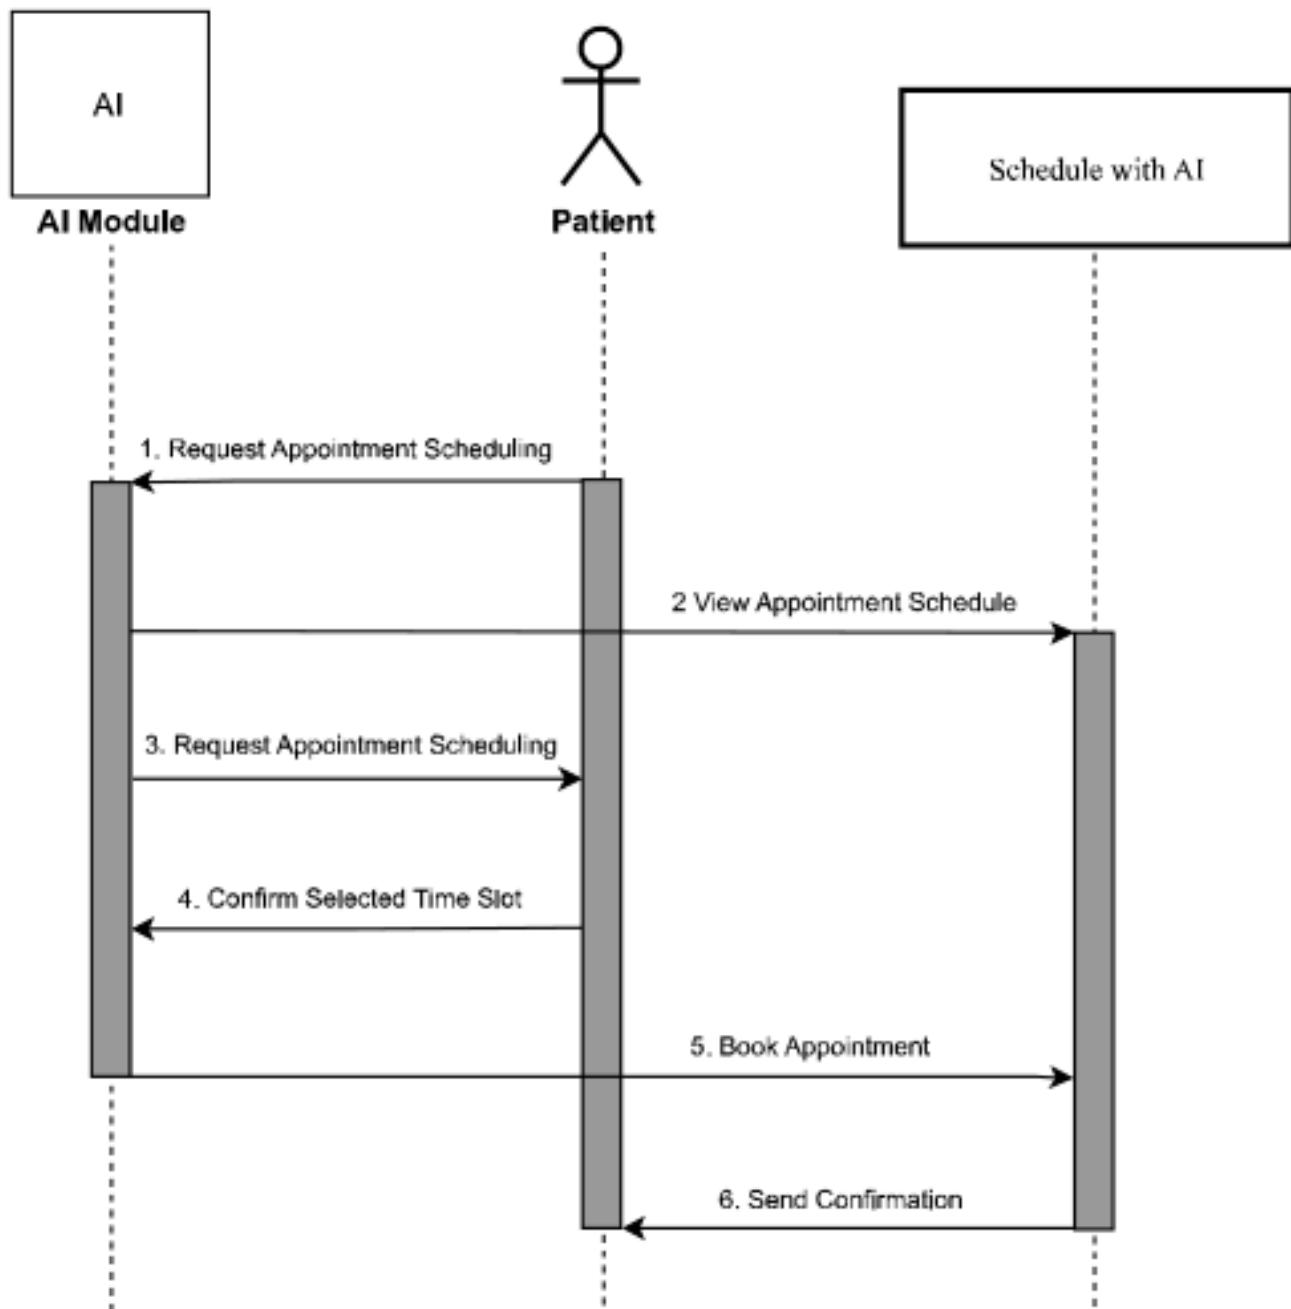

## Section 6: UML Systems Sequence Diagrams

### 6.1. Sequence Diagram: Create Account Use Case (User Management Subsystem)

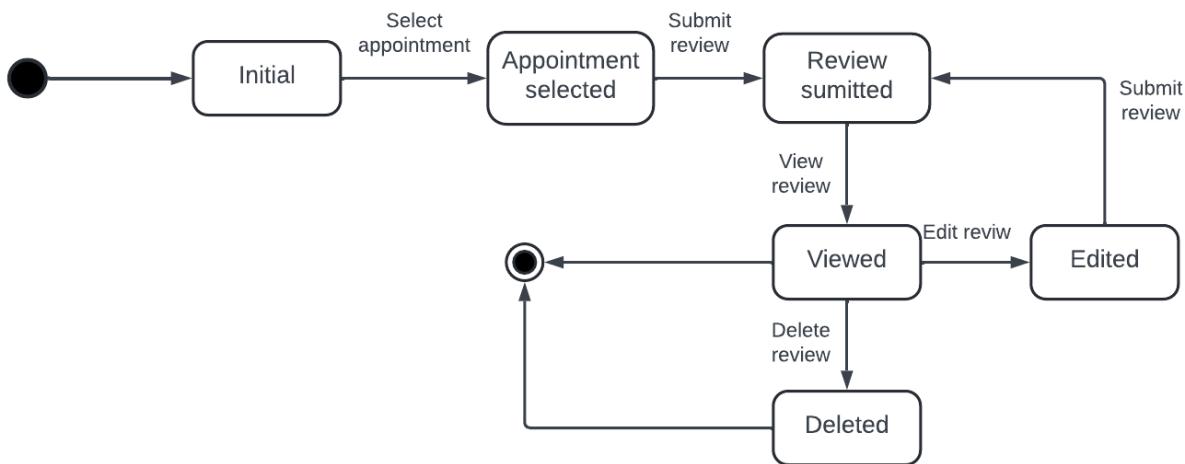

## 6.2. Sequence Diagram: Scheduling with AI Use Case (Appointment Management Subsystem)

## Section 7: Object State Machine Diagrams

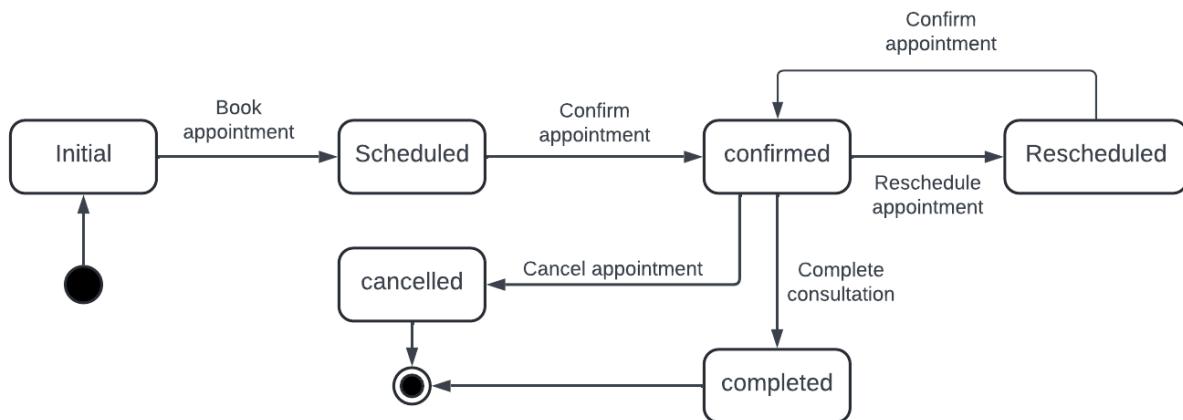

### 7.1 Review State Diagram

#### Class: Review

### 7.2 Appointment State Diagram

#### Class: Appointment

## Section 8: Technologies

The development of the **Queue.Me healthcare system** involves building both mobile and web applications, utilizing a range of tools and technologies at various layers of the application stack. Below is a combined overview of the development approach, detailing the tools used for both types of applications:

### Mobile Application

- **Client Side (Front-end – GUI):**

**React Native:** Using a single codebase, developers can create native mobile apps for iOS and Android with this JavaScript framework. It lowers development time and costs and guarantees a smooth user experience on both platforms.

- **Business Logic (Middle Layer – Class Methods):**

**Node.js with Express.js:** This stack handles request management, back-end communication, and app logic. Large datasets can be handled by Node.js, which makes it perfect for real-time applications in the healthcare industry where instantaneous data access is crucial.

**Tools/Resources:** [Node.js for Mobile App Backend](#)

- **Back End (Database):**

**Oracle DB:** This robust database system is used to manage patient data, medical histories, appointments, and doctor information, ensuring scalability and reliability.

**Tools/Resources:** [Oracle Database Documentation](#)

### Web Application

- **Client Side (Front-end – GUI):**

**React.js:** This JavaScript library is ideal for creating responsive and dynamic user interfaces, particularly for single-page applications. Fast, seamless, and effective

interaction is guaranteed by React.js, which is essential for web-based healthcare management systems.

- **Business Logic (Middle Layer – Class Methods):**

**Node.js with Express.js:** Node.js handles queries from the web client and handles business logic and database interactions, same as in the mobile version.

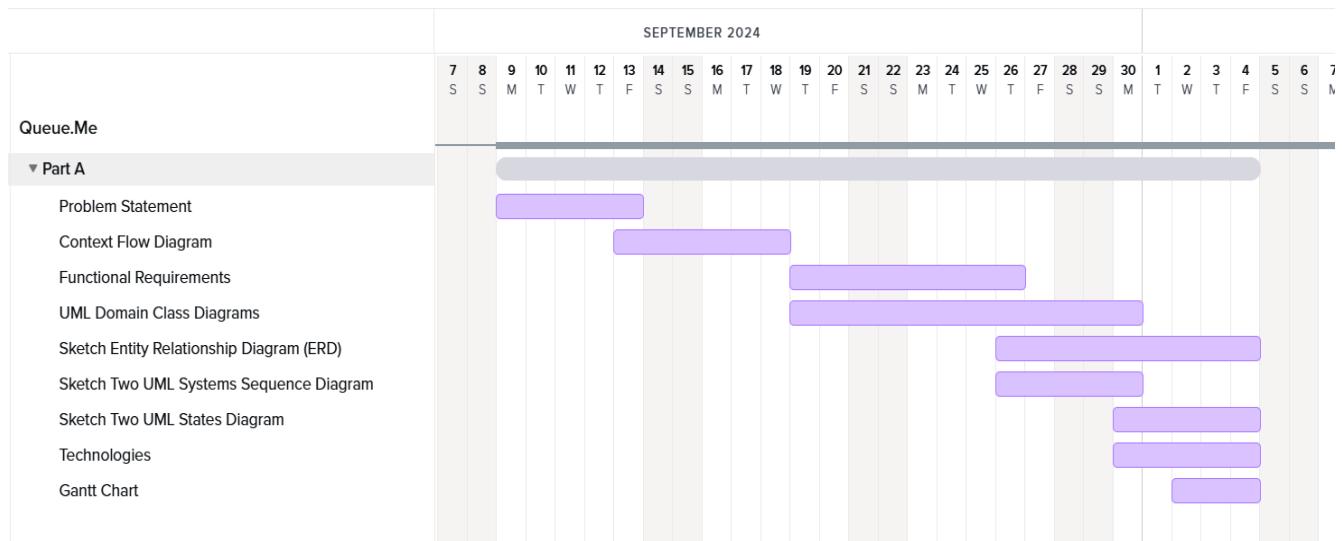

## **Tools/Resources:** Express.js for Web Applications

- **Back End (Database):**

**Oracle DB:** The web application, like its mobile counterpart, stores and manages vital information like medications, appointment details, and patient records using Oracle Database.

**Tools/Resources:** [Oracle for Web Applications](#)

## **Section 9: Project Management**

## Part B: Software Design Architecture

### Section 1: Requirements to Edits to Part A

#### 1.1. Correction on Section 1.1b – List of capabilities and benefits

- Added the list of capabilities and benefits.

#### 1.2. Correction on Section 2 – Context Flow Diagram

- Updated the Context Flow Diagram by merging the AI module with Queue.Me.

#### 1.3. Correction on Section 3.1 – Goal Use Cases List

- Updated the goal use cases list to use the “Verb-Noun” format for nomenclature in use cases.

#### 1.4. Correction on Section 3 – Goal Use Cases List (3.1)

- Added Abstract Uses Cases. Also, the Login, create account and forgot password has been added in the User Management subsystem previously.

#### 1.5. Correction on Section 3 - Use Case Diagrams (3.2) Payment Management Subsystem

- Updated the Use Case Diagram on the Payment Management Subsystem.
- Rather than the doctor, it is the medical staff/receptionist who deals with the processing of payments.

#### 1.6. Correction on Section 3.3 – User Stories for each Sub-system

- Show the use case goal list in this section as per feedback.
- Updated use case 1.2. Manage Profile, to also mention Patient along with the Doctor.

#### 1.7. Correction on Section 3 – User Stories (3.3) Appointment Management Subsystem

- Updated the Book Appointment use case and user story to have a connection with Manage

Appointments/Medical Receptionist to show the empty slots for the particular doctor.

### **1.8. Correction on User Story 3.3. of Share Medical Records**

- Updated the user story for the Share Medical Records

### **1.9. Correction on Domain Class Diagram**

- Updated the Domain Class Diagram

### **1.10. Correction on Section 5 – Entity Relationship Diagram No PK shown for AI chatbot table**

- Added PK for AI Chatbot table
- Updated Entity Relationship Diagram

### **1.11. Correction on Section 6.0 – System Sequence Diagram**

- Updated the two System Sequence Diagram and show the goal use cases instead of the subsystems.

### **1.12. Correction on Section 7.0 – Sketch Two UML State Diagrams**

- Updated the two UML State Diagrams and show two classes from the domain class diagram.

### **1.13. Correction on Section 9 – Project Management**

- Updated the Gantt Chart to more professional as per feedback.

## Section 2: Overview Model

### 2.1. Intended users of the SDD document

This document for the Queue.Me system is intended for a variety of users involved in the project.

- Software Developers - Developers are the primary users of the SDD for implementation guidance. They use it as a technical reference to understand the system's architecture, design specifications, and component interactions.

Tasks: They focus on functional and non-functional requirements, ensuring that each module is developed as intended. The SDD provides detailed diagrams, class structures, and interface descriptions, which developers use to write code that aligns with the documented design.

- Project Managers (PM) - Project managers review the SDD to gain an understanding of the system's architecture and complexity, which helps them oversee the project lifecycle and resource allocation.

Tasks: They use the introductory sections and high-level descriptions to identify deliverables, set timelines, and allocate tasks based on the workload each module represents. They also track project milestones and ensure each phase meets the documented requirements.

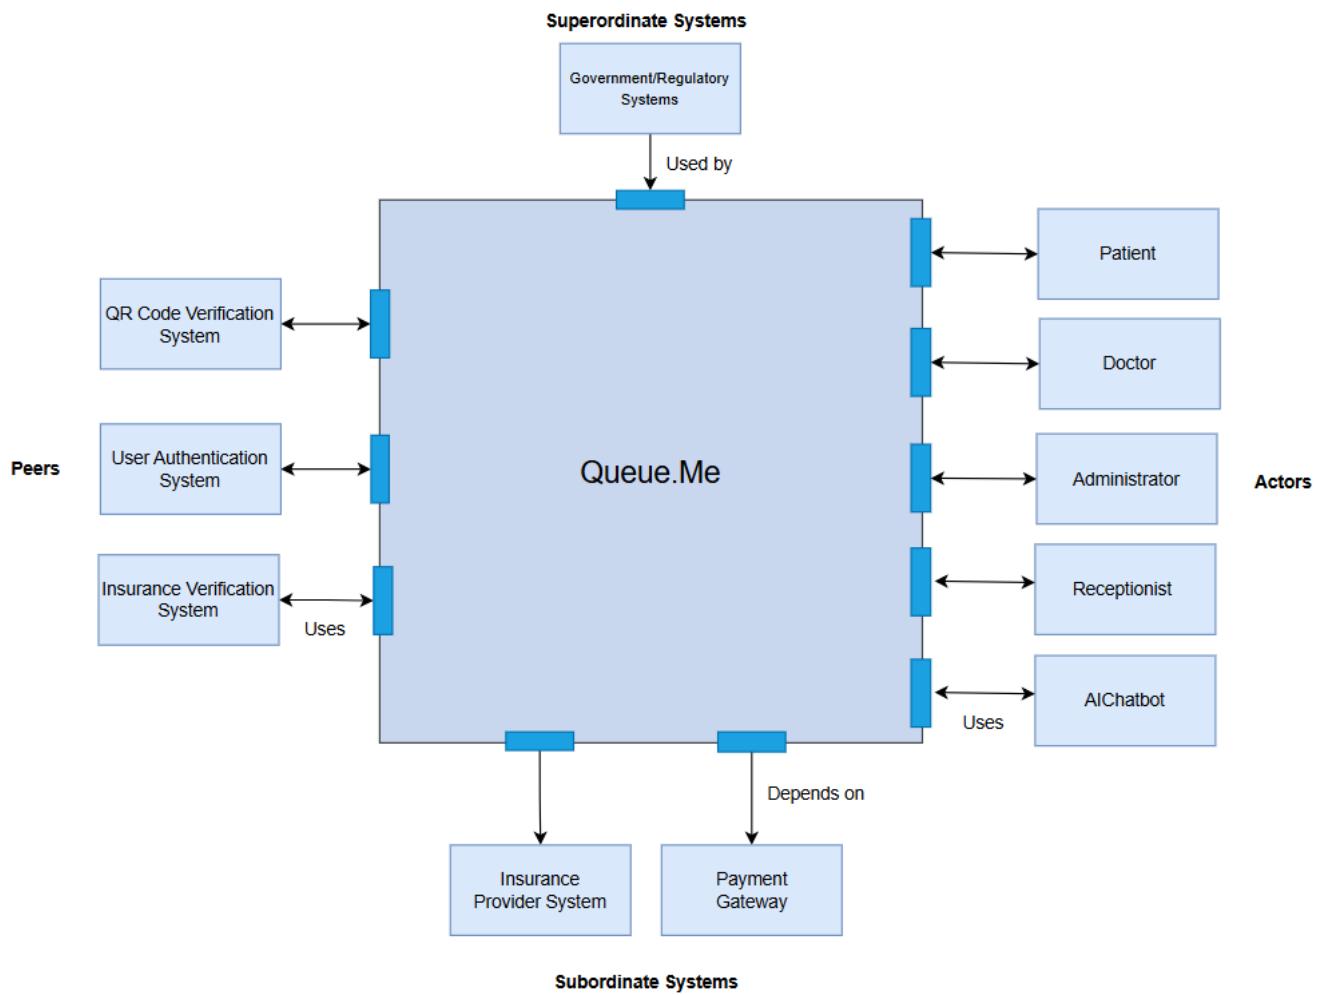

- Business Analysts/Product Owners (BA/PO) - Business analysts and product owners reference the SDD to verify that the design aligns with the product vision and stakeholder requirements.

Tasks: BAs and POs concentrate on the requirements sections, making sure that business needs are accurately represented and that the design will deliver value to end-users. They communicate feedback from stakeholders and may suggest design adjustments if requirements evolve.

- Software Quality Assurance (QA) Engineers - QA engineers use the SDD to develop test plans and validation criteria, ensuring that the system meets specified requirements.

Tasks: They focus on functional requirements and system features to understand expected behaviors and edge cases. Using this, they create test cases that cover all critical paths and potential issues, thereby ensuring the software is robust and free of defects.

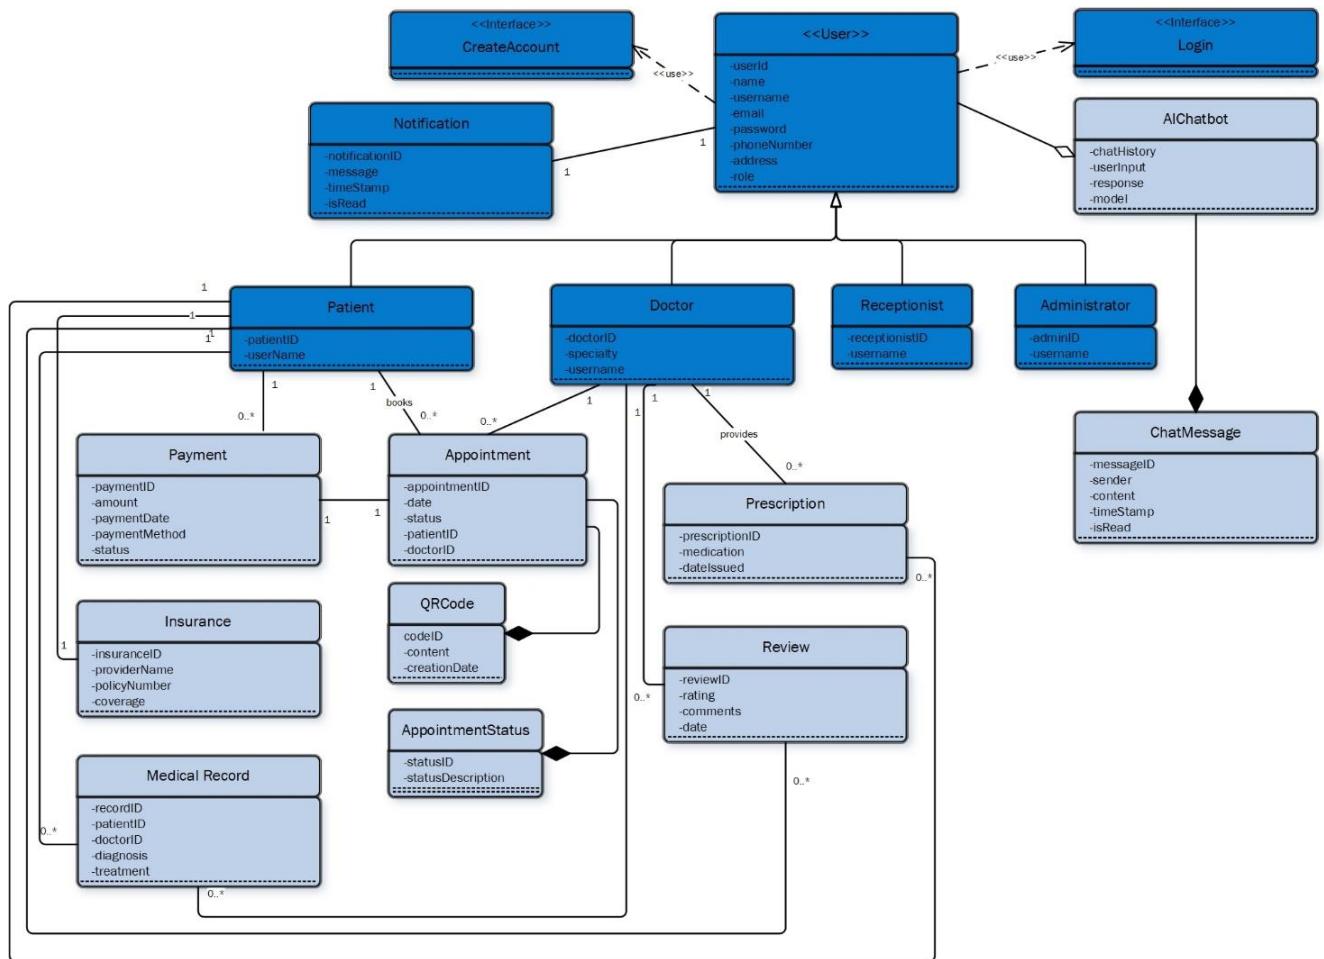

## 2.2. Architectural Context Diagram (ACD)

## Section 3: Modularization

### 3.1. User Management Subsystem

### 3.4.3. Design Class Model

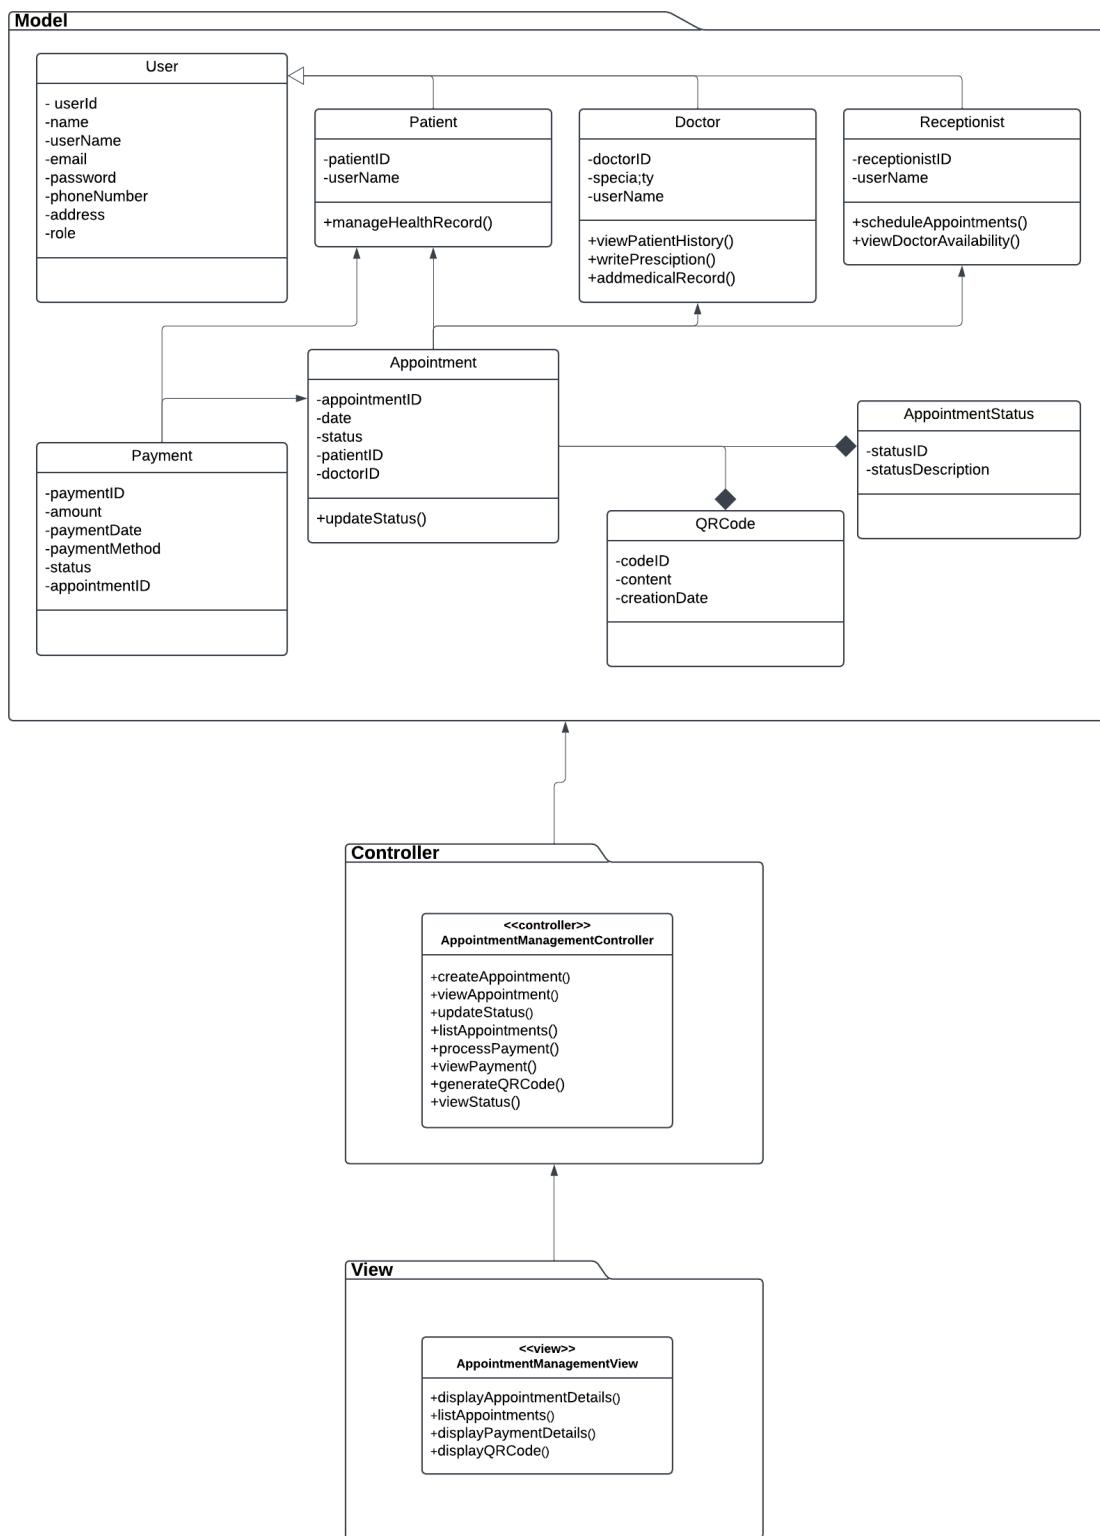

## Section 4: Framework M(odel) V(iew) C(ontroller)

### 4.1. MVC pattern

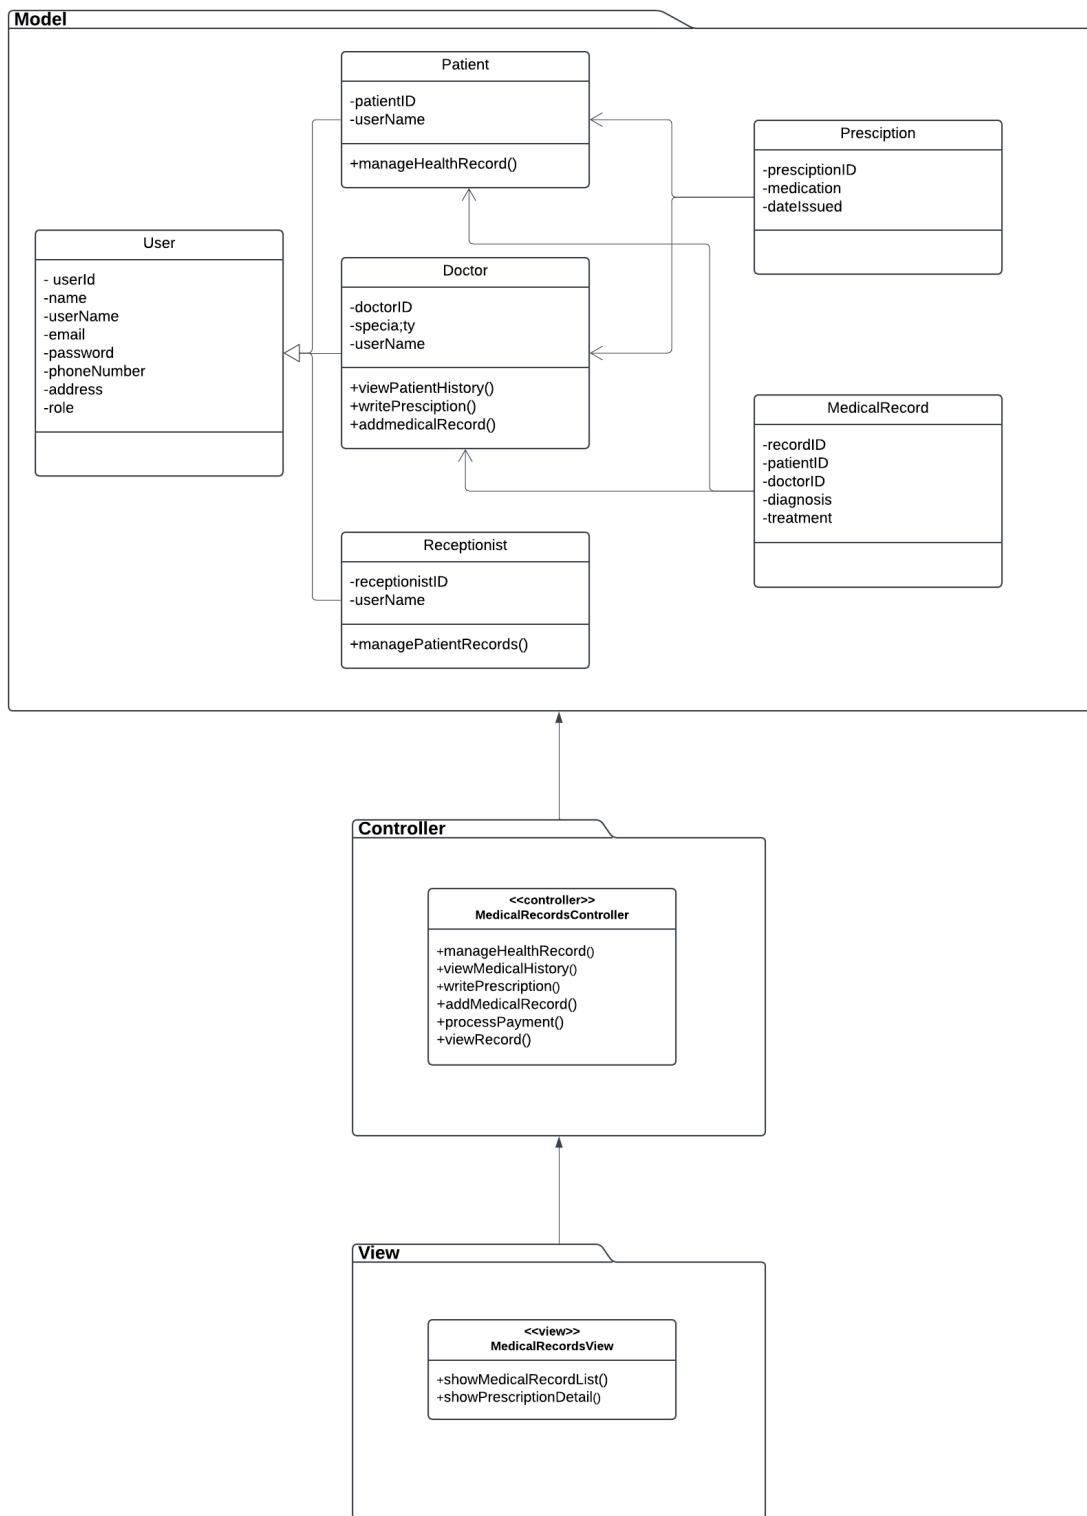

#### 4.1.1. User Management Subsystem

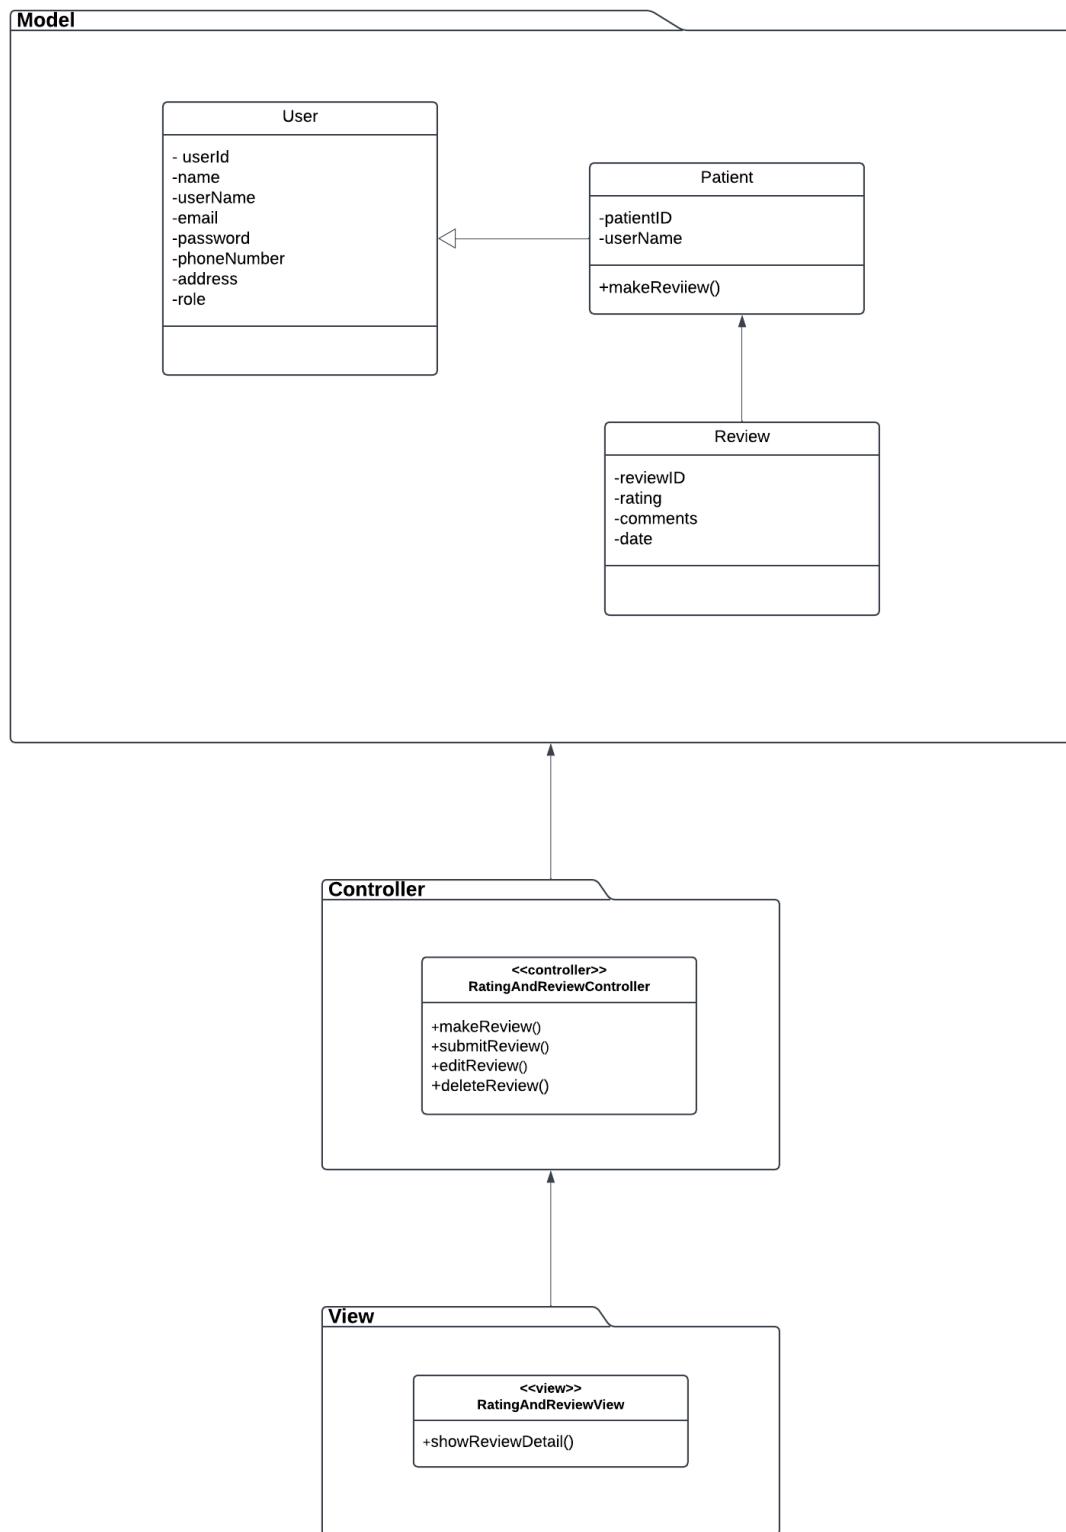

#### 4.1.2. Appointment Management Subsystem

#### 4.1.3. Medical Records Subsystem

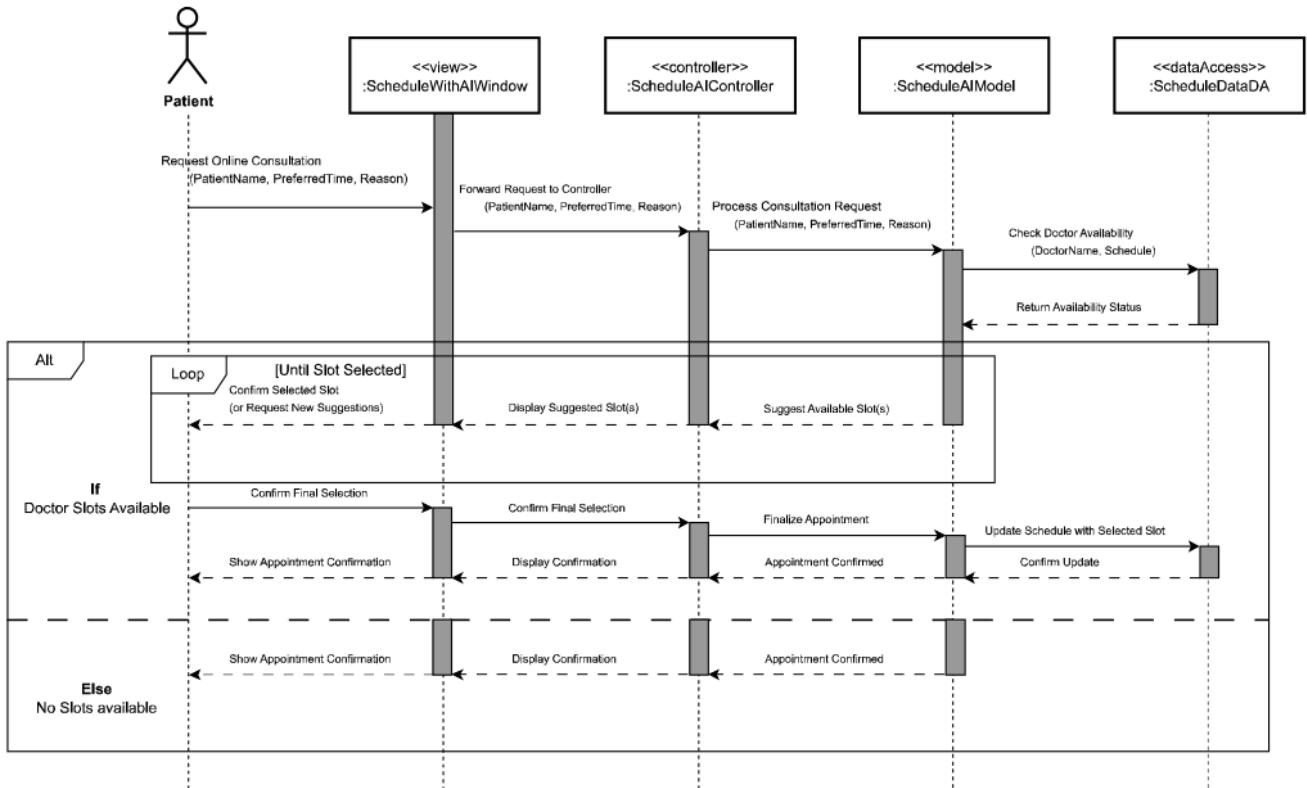

#### 4.1.3. Rating and Review Subsystem

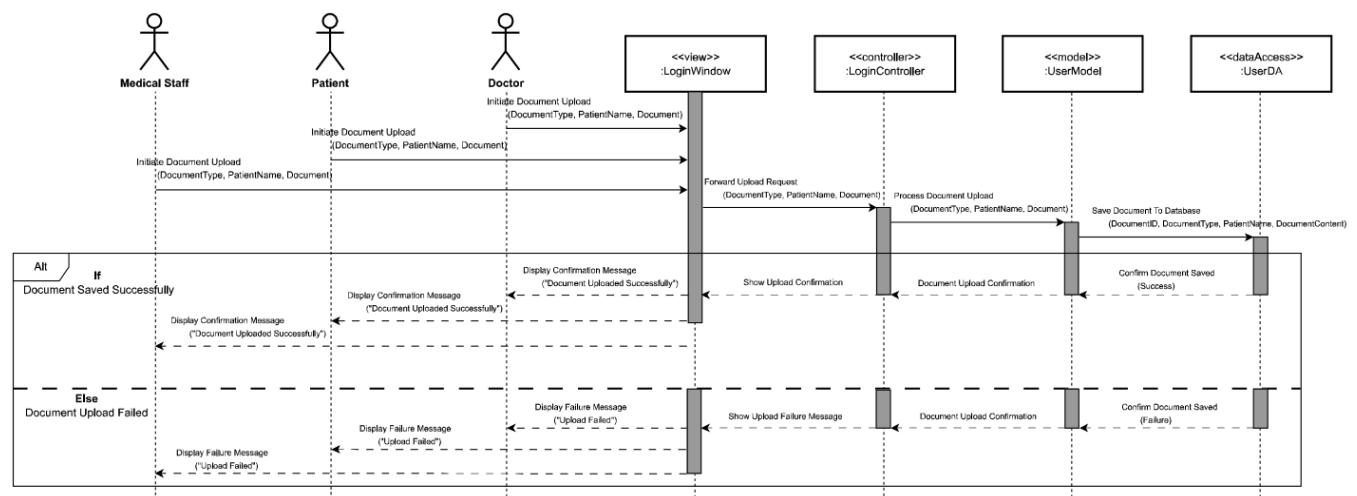

## 4.2. Full Sequence Diagrams

Use Case: Schedule with AI (in the Appointment Management Subsystem)

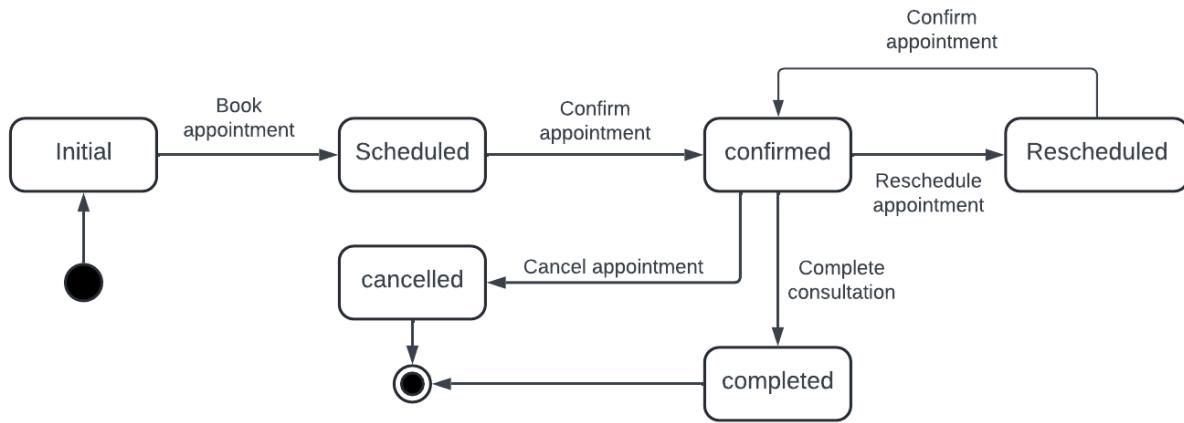

Use Case: Upload Documents (in the Medical Records Management Subsystem)

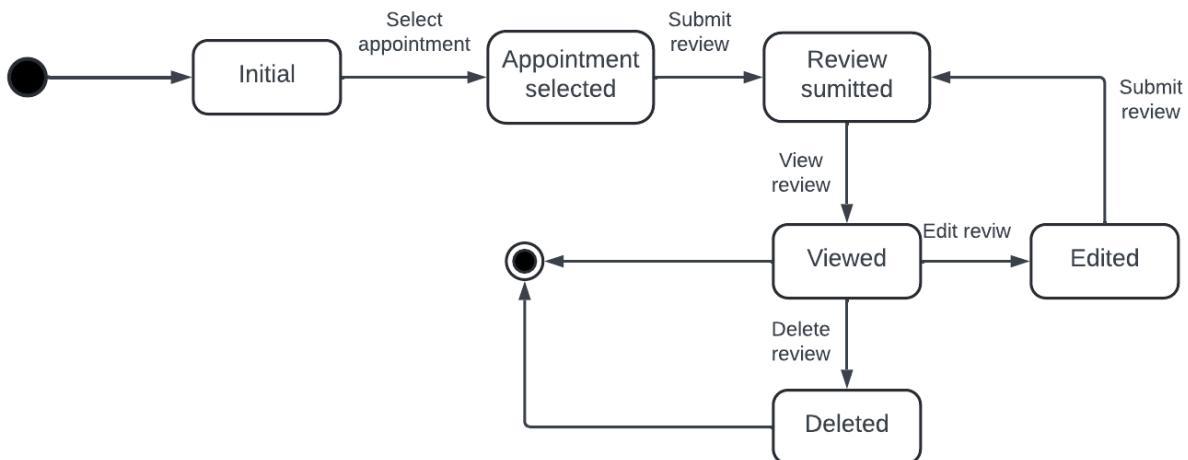

### 4.3. State Machine Diagrams

#### Class: Appointment

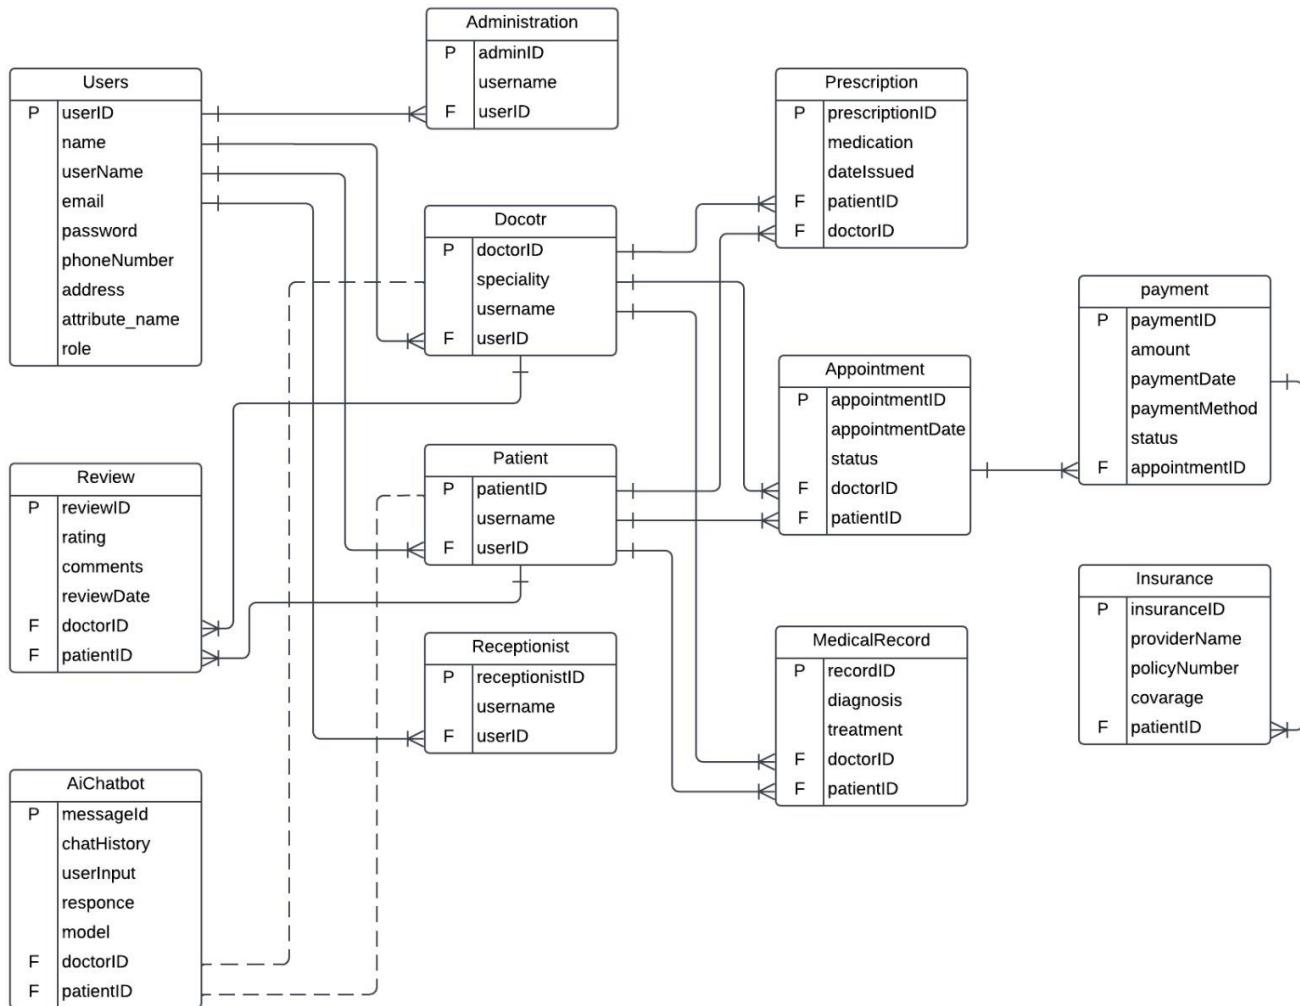

#### Class: Review

## Section 5: Data Layer

### 5.1. Show a database schema with attributes, data types and sizes for each of the tables

## 5.2. Technology List Update

### Additional Technologies

#### AI and Machine Learning:

- TensorFlow/PyTorch: For building and integrating AI models (e.g., AI chatbots for scheduling, medical image analysis).
- Natural Language Processing (NLP) Toolkit: To support the chatbot and automated reminder systems, enhancing patient interaction.

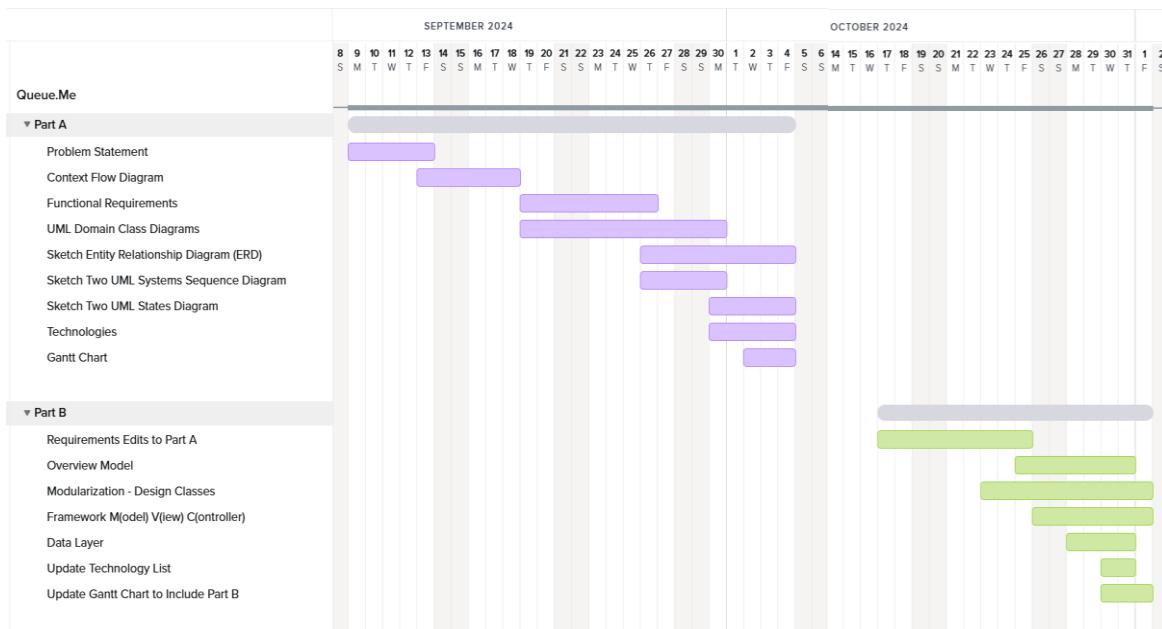

#### DevOps and Infrastructure:

- Docker: Containerization for consistent deployment across environments.
- Kubernetes: For orchestrating containerized applications, offering scalability and resilience.
- AWS / Google Cloud: Cloud services for hosting, database management, and scalable infrastructure.
- Jenkins / GitLab CI/CD: For continuous integration and continuous deployment, automating build and deployment pipelines.

#### Security and Compliance:

- JWT (JSON Web Tokens): For secure, stateless authentication.
- OAuth 2.0: To manage secure third-party access to user data.
- SSL/TLS Encryption: To ensure secure data transmission between clients and servers.
- HIPAA Compliance Tools: Data encryption and access logging tools to comply with healthcare regulations.
- This expanded list offers Queue.Me robust performance, security, and scalability while catering to healthcare-specific needs such as secure data handling and real-time communication.

## Section 6: Project Management

## Part C: System Design Documents

### Section 1.0: Corrections to Part B

#### 1.1. Correction on Section 2.1

- Removed the end users in the Intended users for SDD.

#### 1.2. Correction on Section 2.2 ACD

- Add a superordinated System in the ACD.

#### 1.3. Correction on Section 3

- Updated the format on Section 3: 1) Partition Analysis Model 2) CRC Diagram 3) Design Class Diagrams.
- Updated the colors of the diagrams instead of keeping it as plain white.

#### 1.4. Correction on Section 4.2 Diagram

- Updated the sequence diagram if no slots available, and the timeline to show the differences.

#### 1.5. Correction on Section 5.1

- Updated the Data Layer: Database Schema to use bi-directional relationships with other tables.

#### 1.6. Correction on Section 6: Gantt Chart

- Added another row with days of the week (MTWTFSS).
- Updated the Gantt Chart for Part A-B-C that provides a customized header.

#### 1.7. Correction on Revision History

- Added Part A/Part B/Part C under the Name column for the Revision History table.
- Added Author column

## Section 1: Software Design Patterns

- Façade Pattern
- Observer Pattern
- Singleton Pattern

## Section 2: Using Common Software Design Patterns

### 2.1 Façade Pattern

<b>Name:</b>	Façade Pattern
<b>Problem:</b>	User management, appointment management, and medical records management are some of the subsystems that make up the Queue.Me system. Although each subsystem has unique features, clients (users) who are attempting to access and administer these services face challenges. Users would have to understand and navigate the complexities of each subsystem to interact directly, which would result in a poor user experience and increased maintenance costs.
<b>Solution:</b>	The Façade Pattern provides a unified interface (QueueMeFacade) that wraps complex subsystems, offering simplified access to their functionalities. Instead of each client directly interacting with subsystems, they interact solely with the QueueMeFacade. This facade handles operations by coordinating between subsystems, allowing for streamlined operations, easier code maintenance, and a more user-friendly client experience.  This allows the client to interact with the system through a single entry point without needing to understand the underlying architecture.

<b>Graph:</b>	<pre> classDiagram     class User {         &lt;&lt;Client&gt;&gt;     }     class QueueMeFacade {         +bookAppointment()         +cancelAppointment()         +viewRecords()         +shareRecords()         +createUser()         +updateProfile()     }     class AppointmentManagement {         +schedule()         +reschedule()         +cancel()     }     class MedicalRecordsManagement {         +getRecords()         +shareRecords()     }     class UserManagement {         +createUser()         +updateUser()     }      User "3" --&gt; QueueMeFacade     QueueMeFacade "3" --&gt; AppointmentManagement     QueueMeFacade "3" --&gt; MedicalRecordsManagement     QueueMeFacade "3" --&gt; UserManagement   </pre>
<b>Benefits and consequences:</b>	<p><b>Benefits:</b></p> <ol style="list-style-type: none"> <li>1. Simplified Interaction - To reduce complexity, clients communicate with a single entry point rather than several subsystem interfaces.</li> <li>2. Decoupled Subsystems: The codebase is easier to maintain and expand when subsystems are weakly coupled.</li> <li>3. Enhanced Security: Consistent security checks are made possible by centralized access via the façade, shielding subsystem specifics from unwanted access.</li> <li>4. Flexibility: Subsystems can evolve independently without affecting the client.</li> <li>5. Easier Testing and Maintenance: Since clients only depend on the stable interface of the façade, developers can alter subsystem internals without impacting the client.</li> </ol> <p><b>Consequences:</b></p> <ol style="list-style-type: none"> <li>1. Overhead in Façade Implementation: In order to effectively coordinate interactions among subsystems, the facade layer needs extra coding and maintenance.</li> <li>2. Risk of Over-Simplification: If the facade is not properly constructed, it may</li> </ol>

	<p>oversimplify certain functions, which would prevent clients from taking full advantage of subsystem capabilities.</p> <p>3. Possible Bottleneck: It may become a bottleneck in performance if it is a frequently used entry point, especially if a large number of interactions are routed through it.</p> <p>4. Over-reliance on the Façade: If the façade becomes too complex, it may turn into a bottleneck for extending or maintaining the system.</p>
--	--

## 2.2 Singleton Pattern

<b>Name:</b>	Singleton Pattern
<b>Problem:</b>	<p>The Queue.Me application requires certain components to have only one instance throughout the system's lifecycle. These components include:</p> <ol style="list-style-type: none"> <li>1. Database connection manager</li> <li>2. Configuration settings manager</li> <li>3. Logging service</li> </ol> <p>Having multiple instances of these components could lead to inconsistencies, resource wastage, and potential conflicts in the system.</p>
<b>Solution:</b>	<p>The Singleton pattern ensures that a class has only one instance and provides a global point of access to that instance. In Queue.Me, we can implement Singleton classes for the database connection manager, configuration settings manager, and logging service.</p>
<b>Graph:</b>	<pre> classDiagram     UserClient --&gt; DatabaseManager : Uses     class DatabaseManager {         &lt;&lt;singleton&gt;&gt;         -instance: DatabaseManager         -DatabaseManager         +getInstance(): DatabaseManager         +connect()         +disconnect()     }     DatabaseManager --&gt; instance : instance   </pre>

<b>Benefits and consequences:</b>	<p><b>Benefits:</b></p> <ol style="list-style-type: none"> <li>1. Controlled Access: Ensures only one instance of critical components exists, preventing inconsistencies and conflicts</li> <li>2. Global State: Provides a global point of access to the instance, simplifying system-wide operations</li> <li>3. Lazy Initialization: The instance is created only when it's first requested, conserving system resources</li> <li>4. Reduced Memory Footprint: Only one instance is created, saving memory compared to multiple instances of resource-heavy objects</li> </ol> <p><b>Consequences:</b></p> <ol style="list-style-type: none"> <li>1. Global State Risks: The global state can make the system harder to test and potentially introduce unexpected side effects</li> <li>2. Tight Coupling: Classes using the Singleton become tightly coupled to it, which can make the code less flexible and harder to modify</li> <li>3. Concurrency Challenges: In a multi-threaded environment, special care must be taken to ensure thread-safety during instance creation</li> <li>4. Violation of Single Responsibility Principle: The Singleton class takes on the responsibility of managing its own instance, potentially violating the Single Responsibility Principle</li> </ol>
-----------------------------------	--

## 2.3 Observer Pattern

<b>Name:</b>	Observer Pattern
<b>Problem:</b>	<p>In the Queue.Me system, multiple components or users need to be notified of specific changes in the system in real-time. For instance, when an appointment is booked, canceled, or rescheduled, all relevant parties (patients, doctors, and perhaps administrative staff) need instant updates. Managing such notifications manually can lead to complex code, tight coupling between components, and difficulty in adding new observers (such as new user types) in the future.</p>

<b>Solution:</b>	<p>The Observer Pattern allows a "subject" object to maintain a list of "observer" objects that need to be notified when a particular event or change occurs. In Queue.Me, each component or user interested in appointment updates can register as an observer. When an appointment's status changes, the subject (e.g., an Appointment Manager component) will notify all registered observers automatically. This decouples the objects, making the notification process more flexible and manageable.</p>
<b>Graph:</b>	<pre> classDiagram     class User     class AppointmentManager {         +notifyObservers()         +createAppointment(Appointment)         +updateAppointmentStatus(Appointment, String)         +getAppointmentStatusHistory(String)     }     class PatientObserver {         +update(User)         +updateAppointmentStatus(Appointment)     }     class DoctorObserver {         +update(Doctor)         +updateAppointmentStatus(Appointment)     }     class AdminObserver {         +update(Admin)         +updateAppointmentStatus(Appointment)     }     User --&gt; AppointmentManager     AppointmentManager --&gt; PatientObserver     AppointmentManager --&gt; DoctorObserver     AppointmentManager --&gt; AdminObserver     PatientObserver --&gt; Patient     DoctorObserver --&gt; Doctor     AdminObserver --&gt; Admin   </pre> <p>The diagram illustrates the Observer Pattern. It starts with a <b>User</b> class at the top, which has a relationship with an <b>AppointmentManager</b> class below it. The <b>AppointmentManager</b> class contains four methods: <code>+notifyObservers()</code>, <code>+createAppointment(Appointment)</code>, <code>+updateAppointmentStatus(Appointment, String)</code>, and <code>+getAppointmentStatusHistory(String)</code>. Below the <b>AppointmentManager</b> are three observer classes: <b>PatientObserver</b>, <b>DoctorObserver</b>, and <b>AdminObserver</b>. Each observer class has two methods: <code>+update(User)</code> or <code>+update(Doctor)</code> and <code>+updateAppointmentStatus(Appointment)</code>. Finally, there are three corresponding subject classes at the bottom: <b>Patient</b>, <b>Doctor</b>, and <b>Admin</b>, each receiving notifications from its respective observer.</p>
<b>Benefits and consequences :</b>	<p><b>Benefits:</b></p> <ol style="list-style-type: none"> <li>1. Real-time Notifications: Observers receive instant updates as changes happen, improving user engagement and satisfaction.</li> <li>2. Decoupling of Components: Observers and subjects are loosely coupled, allowing easier maintenance and future expansion.</li> <li>3. Easier to Add New Observers: New components or users can easily subscribe</li> </ol>

	<p>to notifications without altering the core subject.</p> <p>4. Centralized Event Management: The subject manages the notification process, reducing redundancy and potential errors in communication logic.</p> <p><b>Consequences:</b></p> <ol style="list-style-type: none"> <li>1. Potential Performance Overhead: With many observers, real-time notifications could slow down the system, especially if each update triggers multiple complex actions.</li> <li>2. Unintended Dependencies: Over time, the system could accumulate unintended dependencies if too many components rely on each other's updates, complicating the system's behavior.</li> <li>3. Increased Complexity: Managing many observers and their registration or removal can add complexity, especially if not properly managed or documented.</li> </ol>

## Section 3: UI/UX Design

### 3.1 Web

#### 3.1.1 Home page

The screenshot shows the Queue Me home page. At the top, there is a navigation bar with links for "Home", "Our Doctors", "Appointments", "Sign in", "SIGN UP", and "EN". Below the navigation bar, there is a main heading: "Skip long waits at the clinic. Book an appointment and walk in right before your turn." A subtext below it reads: "Book appointments with the right healthcare professional based on your needs, schedule, and location. Simplify your healthcare journey and focus on getting better. Your well-being is just a click away!" To the right of the text, there is a graphic of a hand holding a smartphone displaying a booking interface, with a doctor and patient icon above it. Below this, there is a green button labeled "Get started now". At the bottom of the page, there is a section titled "More than 1 million 5 star reviews" with three review snippets from Google Play. Each snippet includes a 5-star rating icon and a short testimonial.

More than 1 million 5 star reviews

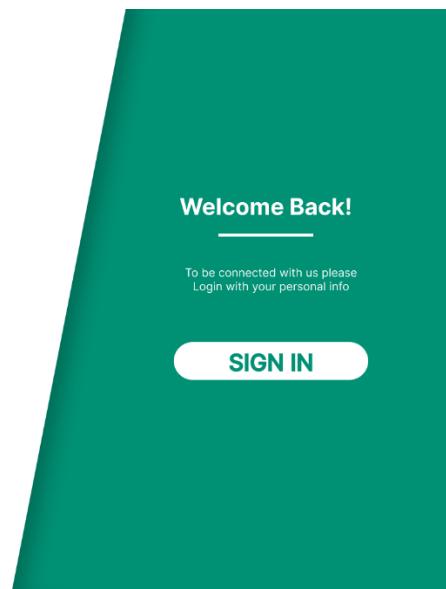

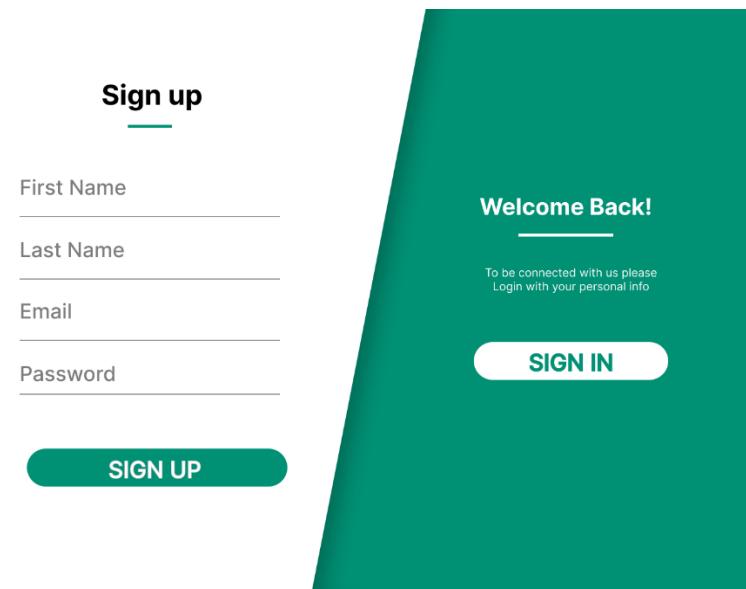

Get the app now [Download on the App Store](#) [GET IT ON Google Play](#)

★★★★★ This app has been lifesaver! I could easily find a doctor nearby who fit my schedule, and the booking process was seamless. The reviewers were super helpful and I loved how I could see reviews for the doctors before booking. Highly recommend it!

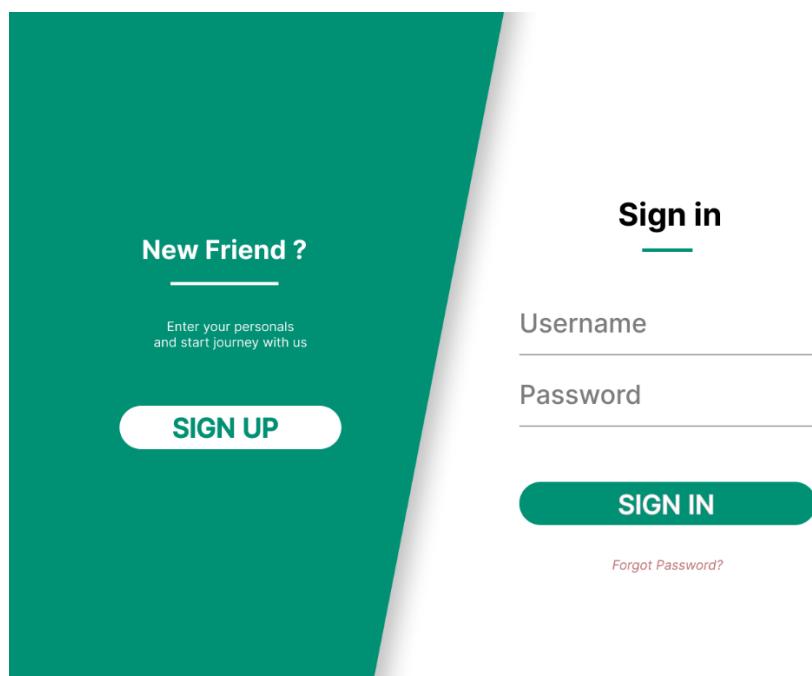

★★★★★ I used to struggle with finding the right specialist, but this platform made it so easy. I found an amazing doctor who really understood my needs, and the virtual consultation option saved me a lot of time. Such a convenient service!

★★★★★ The app works really well, and I love how it shows availability in real-time. The only reason I'm giving 4 stars instead of 5 is that I wish they had more specialists in my area. Otherwise, it's an excellent service!

### 3.1.2 Sign up page

### 3.1.3 Sign in page

### 3.1.4 Dashboard page

The screenshot shows the QueueMe dashboard. On the left, a sidebar menu includes: Overview (selected), Appointments, Medical History, Profile, Help, Setting, and Log out. The main content area features a greeting "Good Morning Enzo!", a question "How are you feeling today?", and a call-to-action "Find the best doctors with QueueMe Book". Below this are two sections: "Appointments" listing four entries for Dr. Bianca Salunga, Dr. Anjelo Tiquio, Dr. Ahmad Albouchi, and Dr. Jaturaput; and "My Reports" listing four entries for a Full Body X-Ray, Prescription, Glucose test, and Blood test.

Doctor	Date
Bianca Salunga	2/11/2024
Anjelo Tiquio	2/11/2024
Ahmad Albouchi	2/11/2024
jaturaput	2/11/2024

Name	Date
Full Body X-Ray	2/11/2024
Prescription	2/11/2024
Glucose	2/11/2024
Blood test	2/11/2024

### 3.1.5 Appointment page

The screenshot shows the QueueMe appointment page. The sidebar is identical to the dashboard. The main area displays a list of four scheduled appointments: Dr. Bianca Salunga (2/11/2024, 11:00 am, Cardiologist, Active), Dr. Anjelo Tiquio (2/11/2024), Dr. Ahmad Albouchi (2/11/2024), and Dr. Jaturaput (2/11/2024). A green "Book new" button is located at the top right of the appointment list.

### 3.1.6 Medical Record/History page

The screenshot shows the Queue.Me medical record interface. At the top, there's a navigation bar with links for Home, Our Doctors, Appointments, and a user profile for Lorenzo Menil Jr. with language settings (EN). The main content area is divided into four sections: Prescriptions, Lab results, Chronic Medications, and Bills.

**Prescriptions:**

Prescription	Date	Status
prescription 1	2/11/2024	✓
prescription 2	2/11/2024	✓
prescription 3	2/11/2024	✓
prescription 4	2/11/2024	✓
prescription 5	2/11/2024	✓

**Lab results:**

Test	Date	Status
knee X-ray	2/11/2024	✓
Blood test	2/11/2024	✓
Ultra sound	2/11/2024	✓
Lab result 4	2/11/2024	✓
Lab result 5	2/11/2024	✓

**Chronic Medications:**

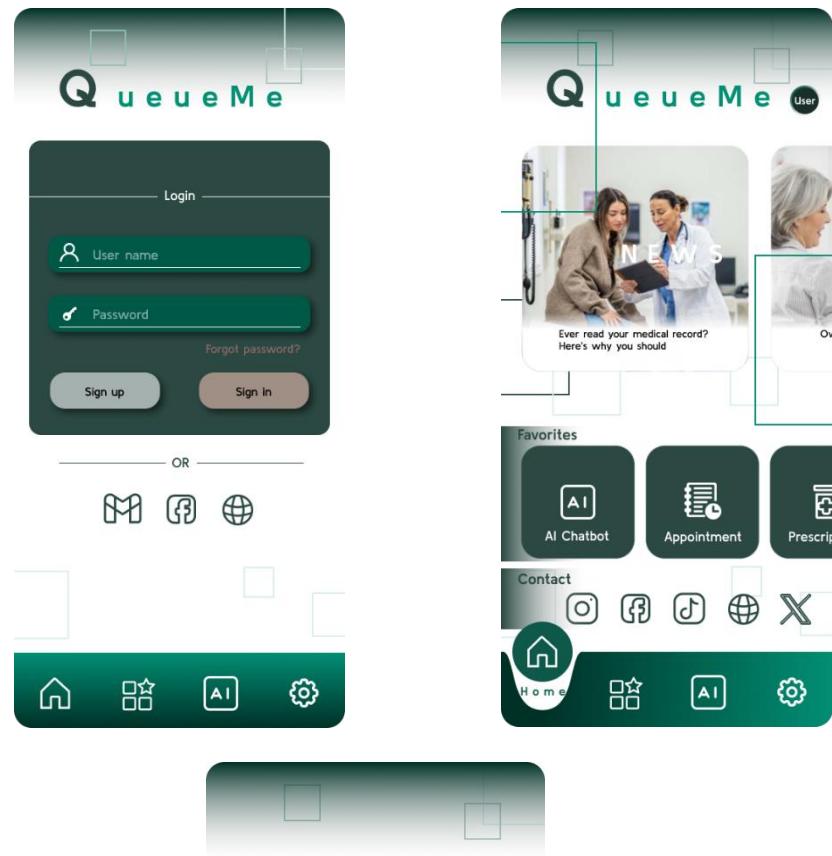

Medication	Date	Status
Aspirin	2/11/2024	✓
Nurofen	2/11/2024	✓
Paracetamol	2/11/2024	✓

**Bills:**

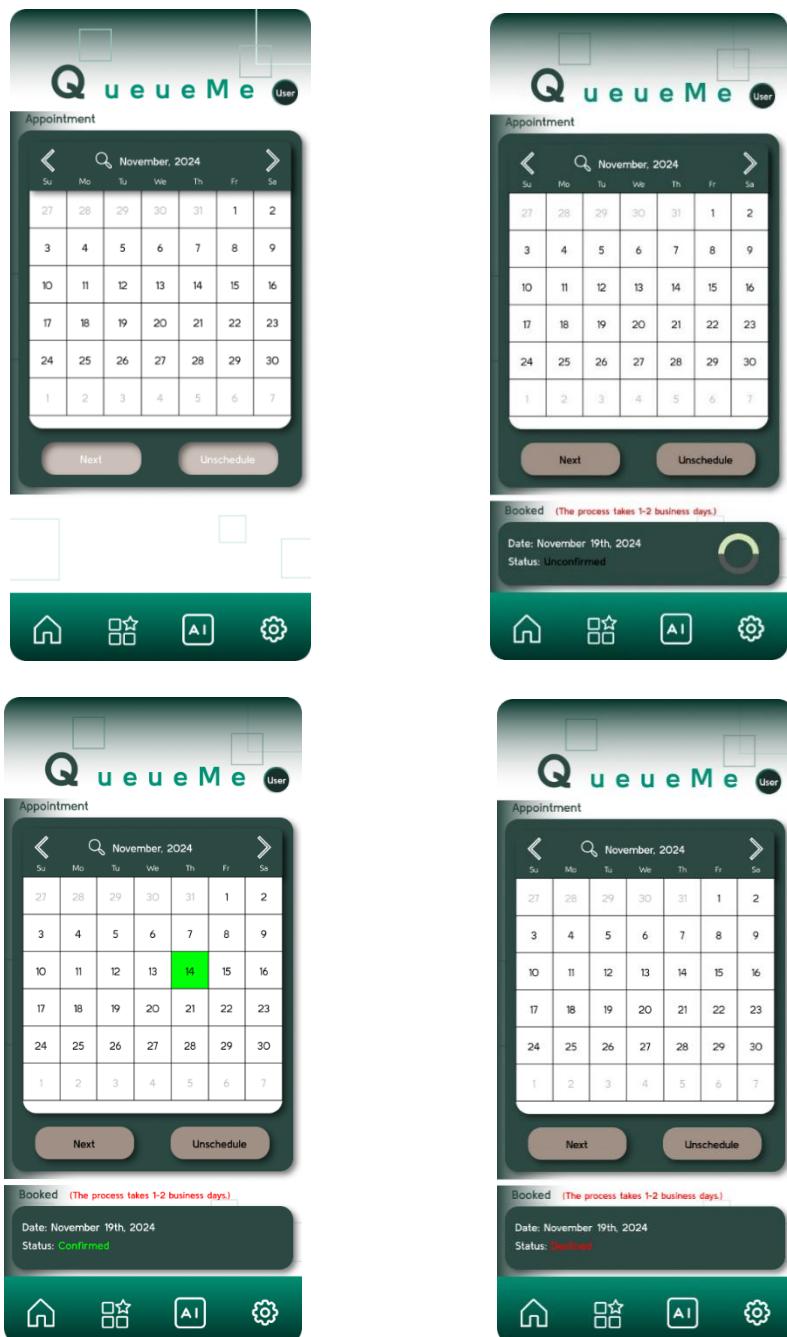

Clinic	Date	Status
Toronto General	2/11/2024	✓
Maple Clinic	2/11/2024	✓
Progress Center ...	2/11/2024	✓
Toronto General	2/11/2024	✓
One Care Clinic	2/11/2024	✓
