Project Overview

This project was completed through an employer-led collaboration via Riipen, where I contributed to both branding and website development for QDM Creative. My responsibilities included designing the company's visual identity, developing a responsive multimedia website, implementing a CMS-driven project management system using Wix Studio, and preparing technical documentation for the client.

Project Objectives

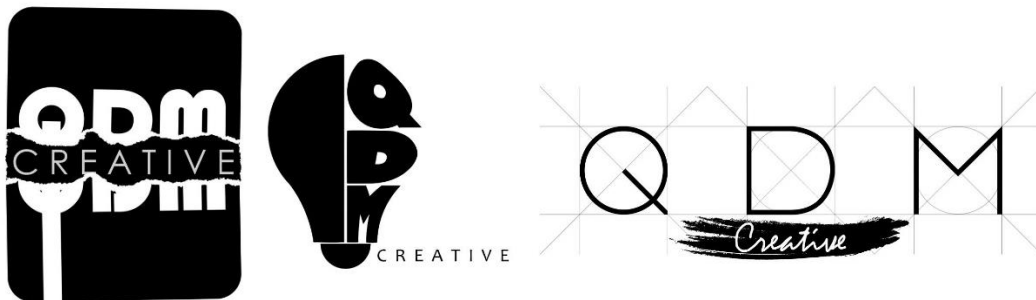

The project aimed to:

- Build a professional and recognizable brand identity.
- Develop a responsive multimedia website for desktop and mobile devices.
- Create a clear information architecture with intuitive navigation.
- Implement a scalable CMS solution for managing project content.
- Deliver a visually engaging and easy-to-maintain website.

My Contributions

Motion Graphics & Branding

As the Motion Graphics Designer, I created the QDM Creative logo and visual identity. The branding focused on minimalism, geometric balance, and clean typography to represent a modern creative agency.

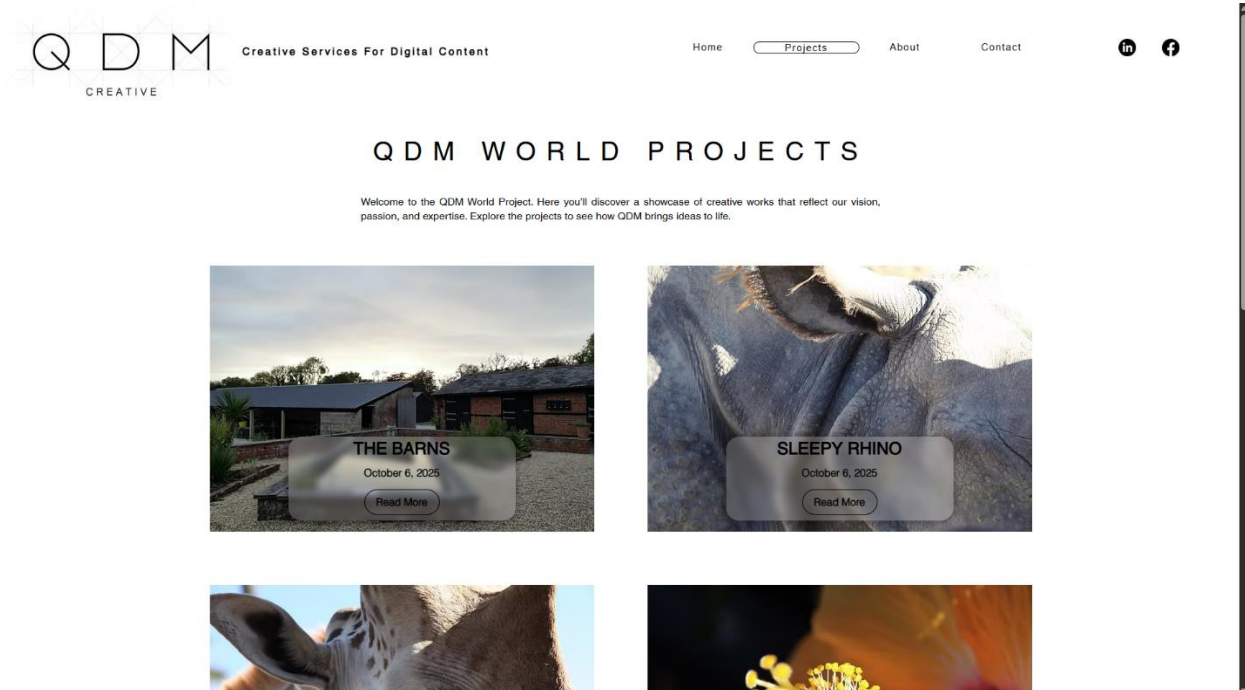

Website Design & Development

As the Website Designer, I designed and developed the website using Wix Studio. I organized the content using a structured parent-to-child navigation hierarchy, allowing visitors to browse projects through multiple navigation paths while maintaining a responsive user experience.

Key features included:

- Responsive layouts for desktop and mobile

- Multimedia integration (images, galleries, and animations)
- Structured navigation hierarchy
- Project showcase pages
- Performance and usability improvements

Wix CMS Implementation

One of the most technically challenging parts of this project was designing and implementing the Wix CMS architecture.

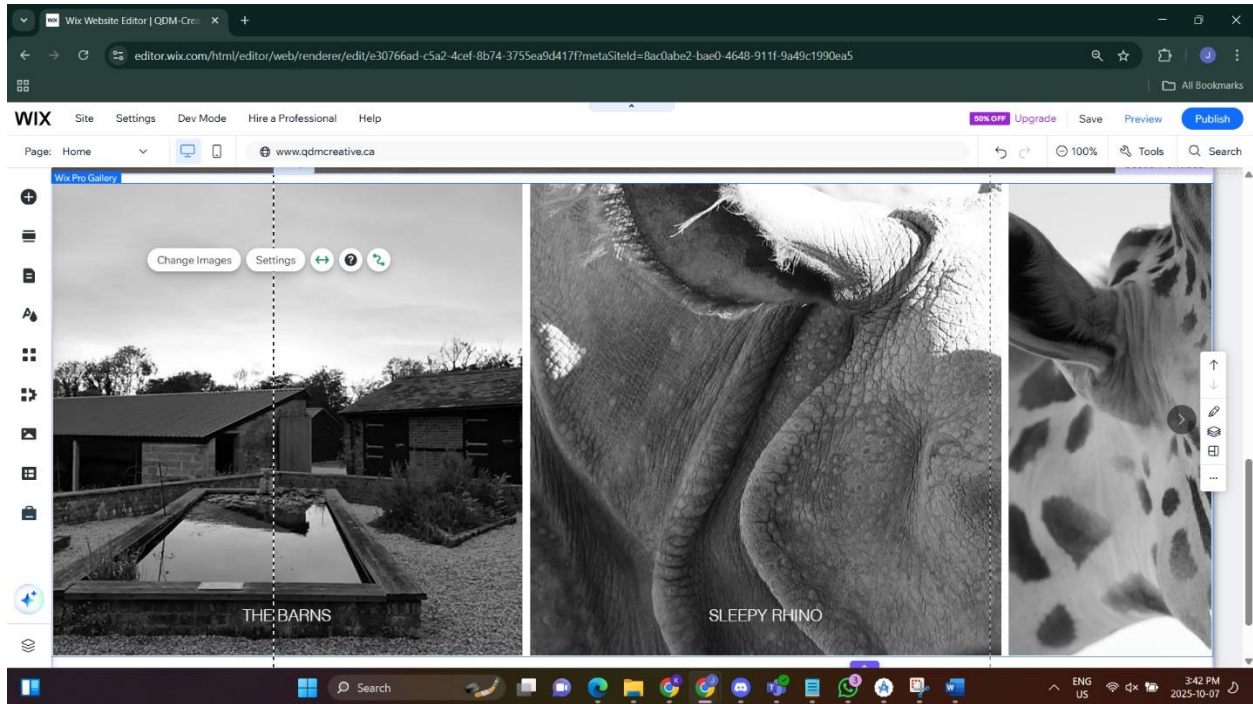

My responsibilities included:

- Creating and organizing CMS Collections
- Building Dynamic Pages connected to CMS data
- Configuring datasets and content bindings
- Connecting galleries, text, images, and other UI components to CMS fields
- Managing project visibility through CMS status controls
- Preparing technical documentation so the client could independently maintain and update website content after project delivery

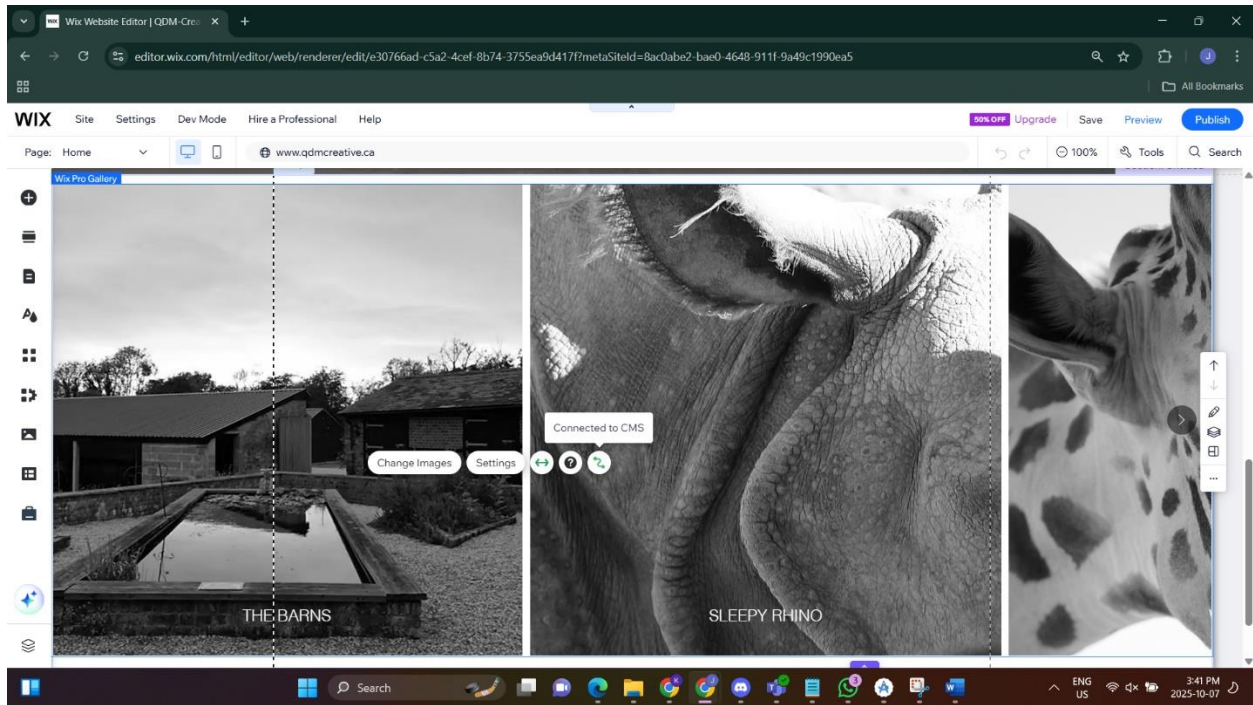

The following pages contain the client documentation I created for managing the Wix CMS.

1. Reconnecting Columns in CMS (Edit Site Mode)

- Go to **Edit Site** mode in the Wix platform.
- Click on the object you want to reconnect (for example, the **Wix Pro Gallery** object at the end of the Home page).

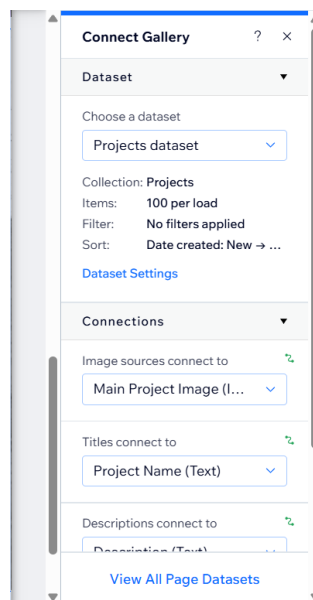

- After selecting the object, click the **CMS icon** (the last icon in the options bar).

(it turns into blue color once you click it)

- This will open the **Connect Gallery** panel on the right side.

- Scroll down to the **Connections** section. You will see options like “**Image sources connect to**”, “**Titles connect to**”, etc.

Projects (Item)

View All Page Datasets

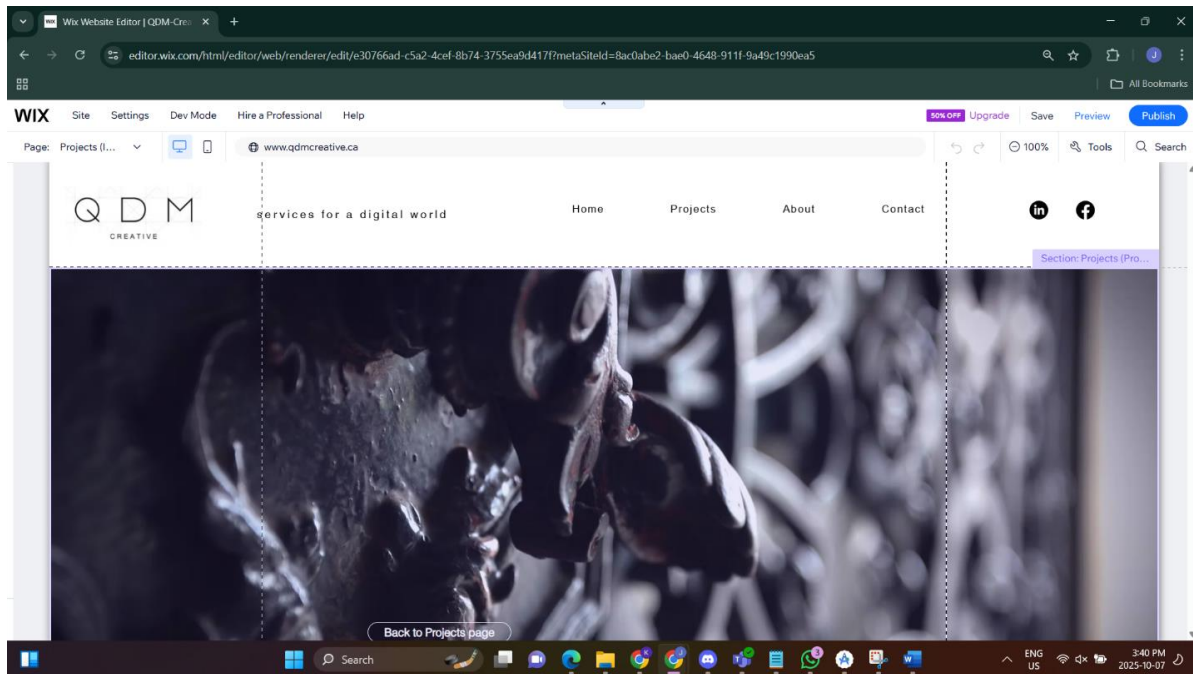

- Choose the column name below the option you want to link to.
- Once selected, click **Save**, then click **Preview** to see the result.

2. Dynamic Page (Accessing a Specific Project Page)

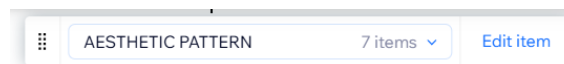

- Click **Pages & Menu** on the left sidebar.
- Select **Dynamic Pages**, then choose **Project Item**.

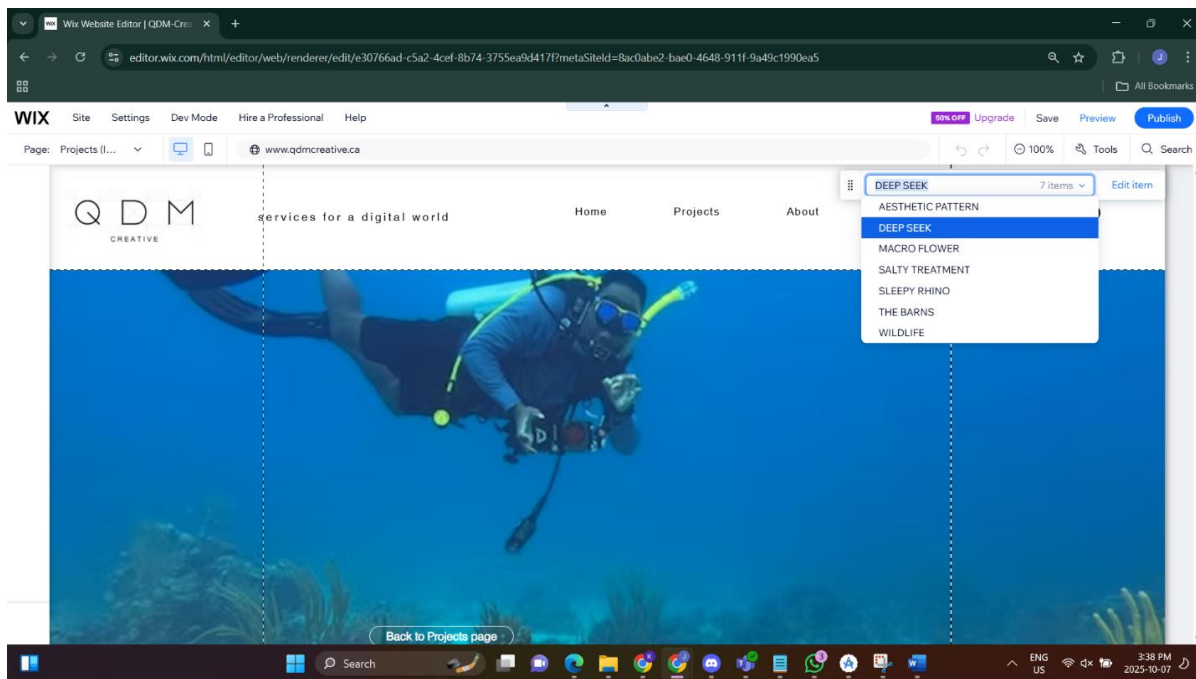

- This will take you to the specific project page setup.

- To switch between different project pages, look at the small popup bar that appears on the right side of the editor.

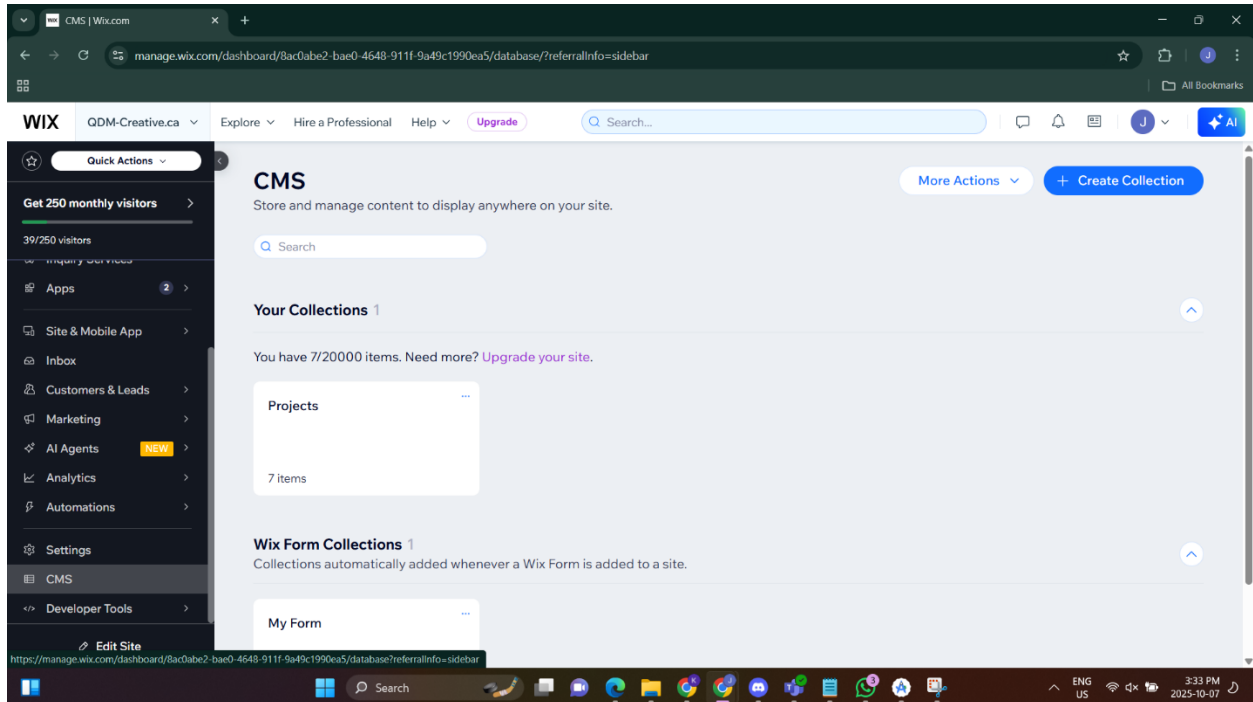

- From the list, select the specific project you want to view (for example, **DEEP SEEK** as shown in the attached image).

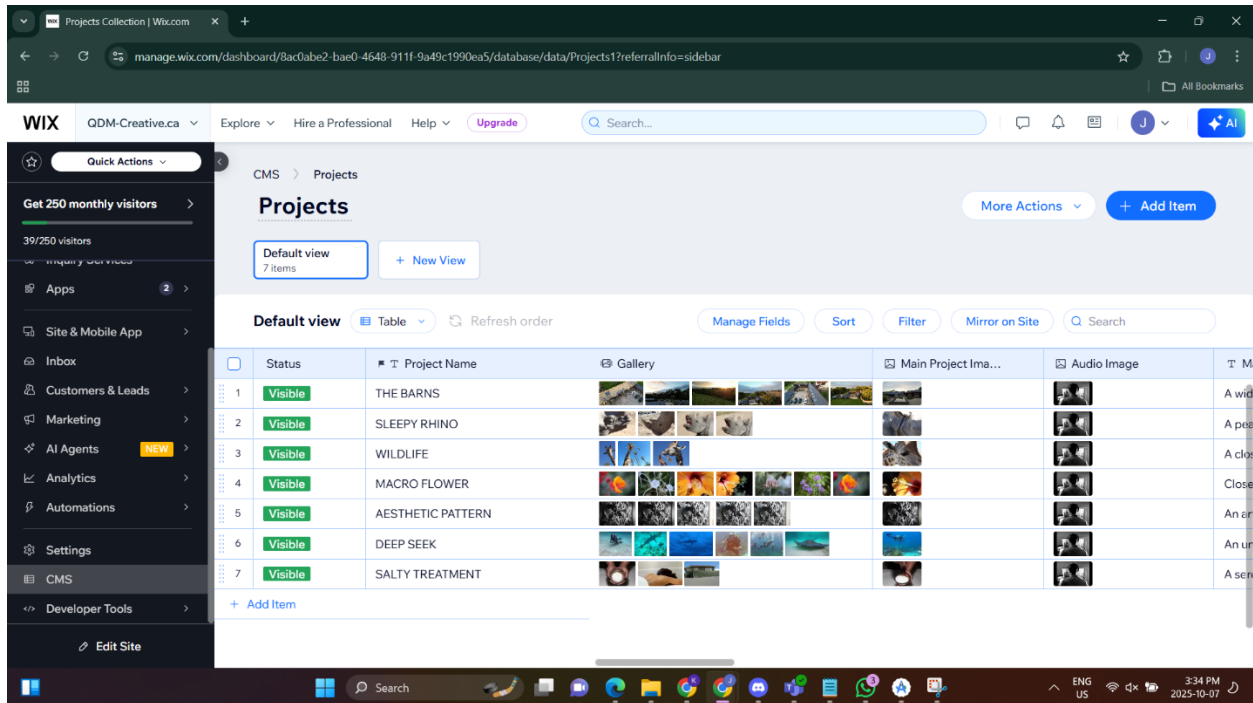

- Once selected, the editor will display that project's page so you can edit it directly.

3. CMS in Dashboard (Managing the CSV File)

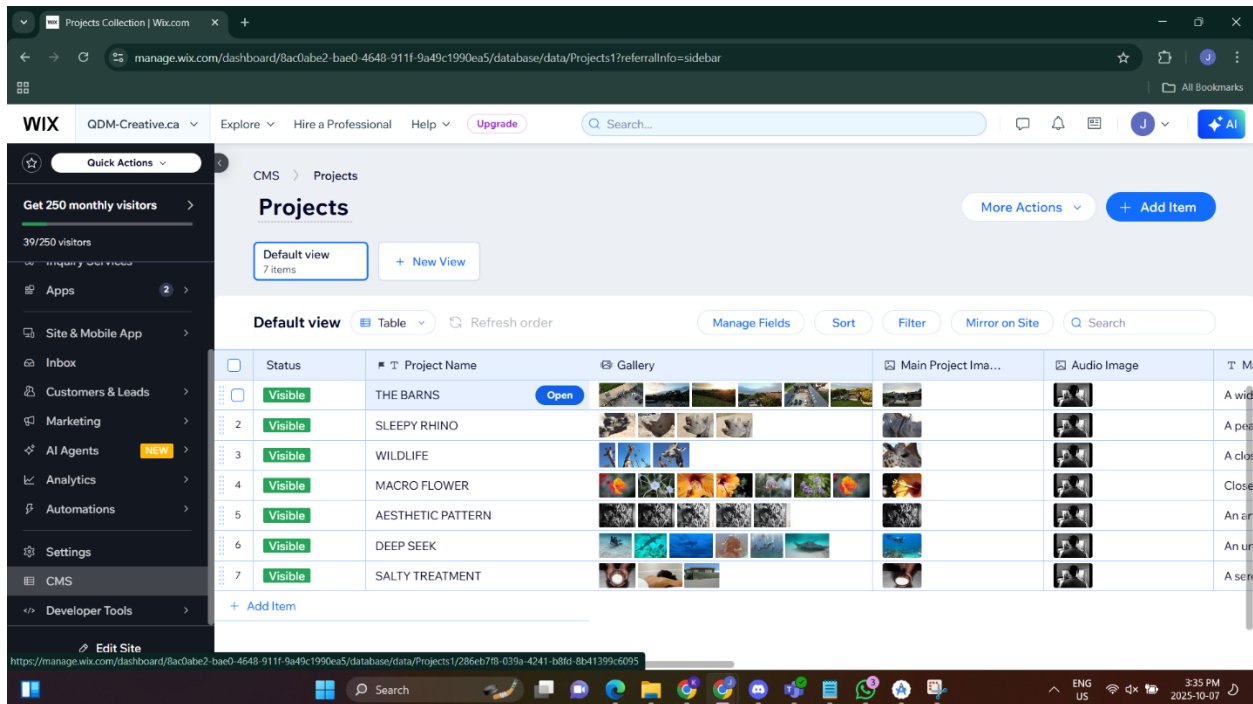

- From the **Wix Dashboard**, click **CMS** on the left sidebar.

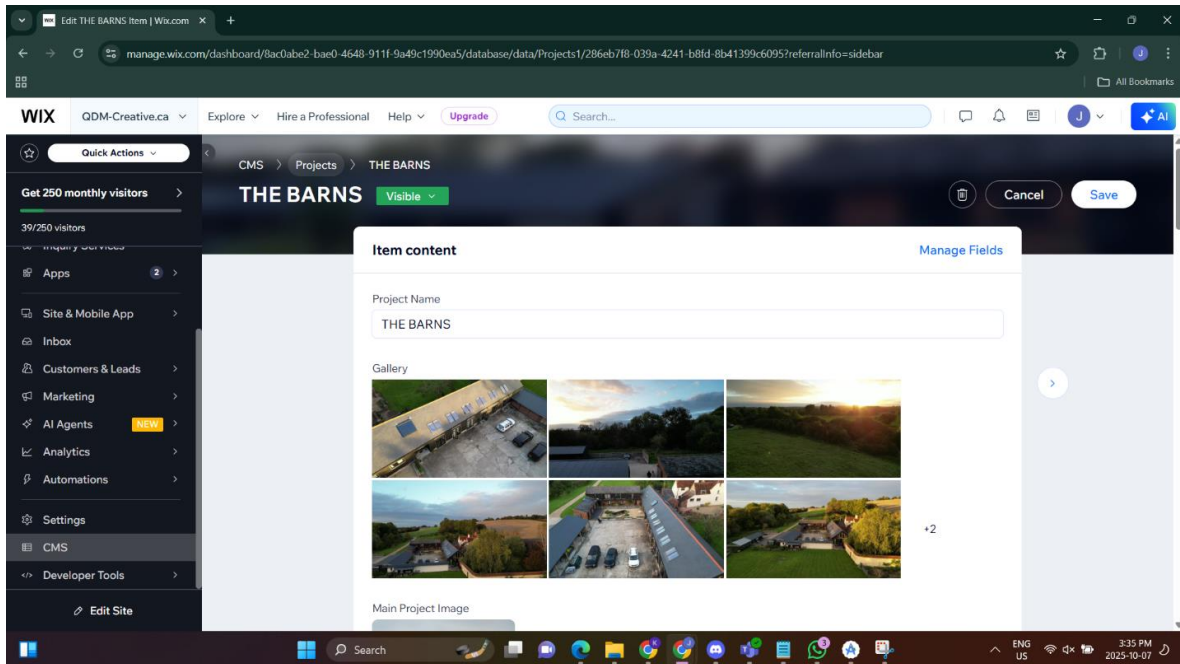

- You'll land on the CMS page (as shown in the attached image).
- Under **Your Collections**, click the file named **Projects**. This is the CSV collection I already created for you.
- Once opened, you'll see all your project data organized into clearly named columns for easy editing.

- To modify a project, click the **Open** button next to its name in the **Project Name** column.

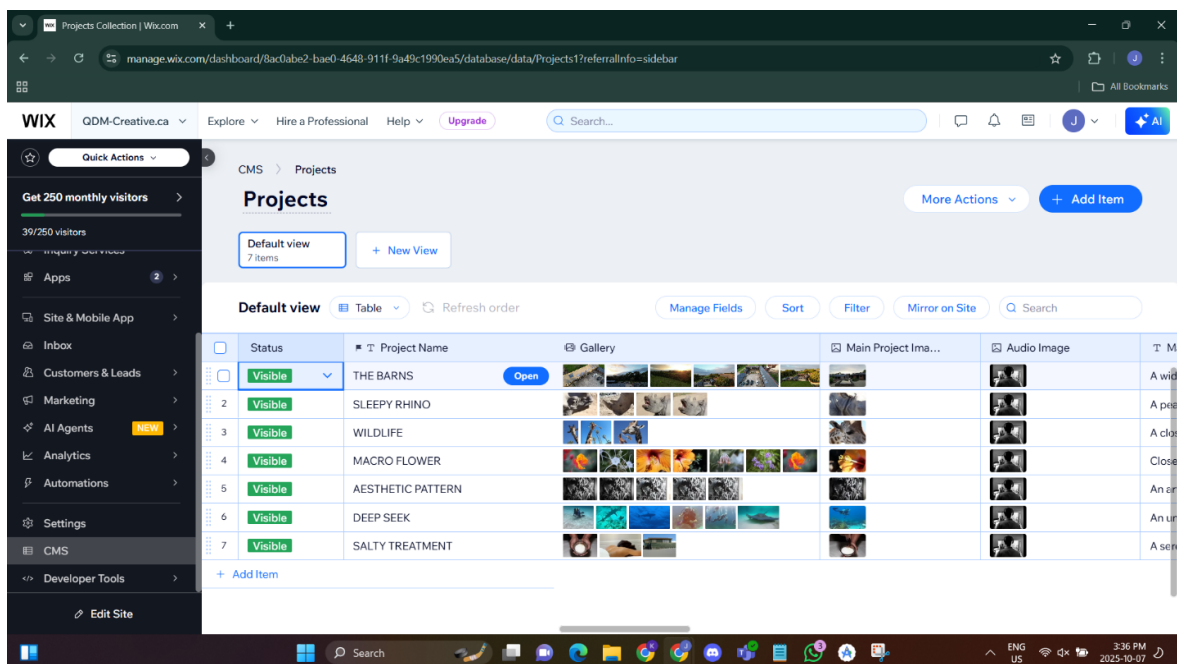

- You can update images, descriptions, and any details from this page.
- When finished, click **Save** or click **Projects** at the top-left corner to return (clicking “Projects” usually saves faster if “Save” takes too long).

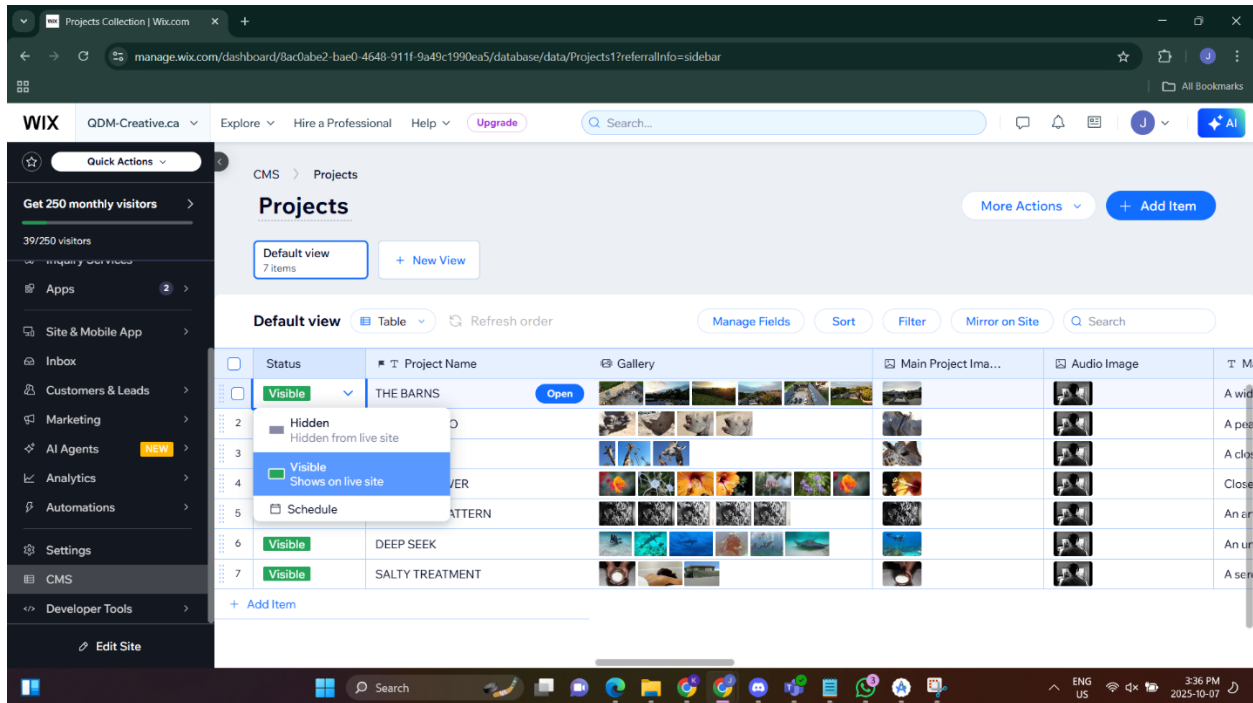

- On my laptop, I noticed saving can sometimes take time, but this might not happen on your device.

4. Managing Visibility (Visible or Hidden Projects)

- From the Wix Dashboard, go to CMS → Projects (the CSV file name I created).

- In the **Status** column, click the dropdown arrow next to the status of a specific project.

- Choose **Hidden** if you want to hide the project from the website.
- To make it visible again, simply select **Visible** from the same dropdown list.

Project Outcome

This project successfully delivered a professional brand identity, a responsive multimedia website, and a scalable Wix CMS solution for QDM Creative. The implemented CMS architecture allows the client to independently manage project content, update dynamic pages, and control project visibility without requiring additional development support.

Through this project, I gained practical experience in Wix Studio development, CMS architecture design, dynamic page implementation, content binding configuration, responsive web design, and client documentation preparation. The work demonstrated both technical implementation skills and the ability to create maintainable solutions for real-world business requirements.

The documentation above represents the CMS management system I designed and implemented as part of the overall QDM Creative website project.
